MESSAGE TO THE INSTALLER

The PowerMaxPro control panel is supplied with 2 instruction manuals:
- Installer Guide (this manual - for your exclusive use)
- User’s Guide (for your use during installation only - Must be handed over to the master user after testing the system).

Appendices A.1 and A.2 will help you prepare an installation plan. Please take time to fill out the forms - your job will become much easier and confusion will be prevented. Filling out the forms will also help you create a list of detectors and transmitters that must be obtained for the particular application. Compatible detectors and transmitters are listed and described briefly in Appendix E.

Remember - it is advisable to power up the control panel temporarily after unpacking and program it on the work bench, in accordance with the installation plan.

The programming flow charts in the programming section show all options available for each parameter. Factory defaults are marked with a dark box to their right, and other options (that can be selected instead) are marked by clear boxes. This method allows you to put a checkmark in the appropriate clear box whenever you deviate from the factory defaults.

Most of the programming section paragraph numbers correlate with the programming menu numbers. For example, paragraph 4.4.19 describes the "Jam detect", that exists in menu 4 (define panel), sub-menu 19 (Jam detect).

Although setting the correct time and date is one of the user tasks, we recommend that you set the time and date in the course of programming. Access to the “User Settings” for the installer is possible through item 10 on the installer’s menu or through the user menu (see User’s manual section 7).

After programming, proceed to install the system as detailed in the Installation Instructions, from paragraph 3.4 onward.

The installer should verify line seizure. Be aware of other phone line services such as DSL. If DSL service is present on the phone line, you must install a filter. It is suggested to use the DSL alarm filter model Z-A431PJ31X manufactured by Excelsus Technologies, or equivalent. This filter simply plugs into the RJ-31X jack and allows alarm reporting without breaking the internet connection. If the user has a Voice over IP phone system only, the control panel will not be able to communicate with the central station via the PSTN telephone line. In this case, the user will either need to install an additional telephone line, or connect a GSM module.
1. INTRODUCTION

The PowerMaxPro is a user and installer-friendly, 30-zone fully-supervised wireless control system. The system is designed to function in a way that appeals to the user but also offers features that make installers’ life easier than ever before.

The PowerMaxPro includes an optional partition feature. Partitioning allows you to have up to three independently controllable areas with different user codes assigned to each partition or one user code assigned to a combination of up to 3 partitions. Partitions can be armed or disarmed individually or altogether in one operation. For example, you can define the garage as partition 1, the basement as partition 2 and the house as partition 3. Since each partition is independent of other partitions, you can arm or disarm each partition as desired without altering the states of the other partitions.

EASY TO INSTALL
- Plug-in terminal blocks in "Zones", "Dual RS-232" and "Phone" modules, can be wired while detached from the unit.
- Quick attach-detach TELCO sockets for telephone line and X-10 controller. Includes a terminal block for telephone line & set.
- Special wall-mounted bracket permits installation without having to open the unit’s plastic casing.
- Optional plug-in dual RS-232 module that enables a concurrent connection of a PowerLink or local computer (only 2 simultaneous device connections).

EASY TO MAINTAIN
- Status, alarm memory and trouble data are displayed upon request.
- Diagnostic test provides visual and audible indication of the signal level of each detector.
- Remote control and status verification from distant telephones.
- Event log stores and displays information on 100 most recent events.
- Upload / download from distant computer via telephone line and modem.

QUICK PROGRAMMING
- Multiple-choice selection of options for each parameter.
- Unequivocal visual prompts and audible signals.
- Installer access to the user menu.

2. SPECIFICATIONS

2.1 General Data

Zones Number: 28 wireless, 2 hardwired (zones 29 & 30).
Hardwired Zone Requirements: 2.2 kΩ E.O.L. resistance (max. resistance of wires 220Ω).
Zone Types: Interior follower, interior, perimeter, perimeter follower, delay 1, delay 2, 24h silent, 24h audible, fire, non-alarm, emergency, gas, flood, temperature and home / delay.
User Codes: 8 codes, 4 digits each (9999 different combinations). Code 0000 is not allowed.
Control Facilities:
- Integral keypad
- PowerCode / Code-Secure™ hand-held transmitters
- One-way / two-way keypads
- Optional Built-In Proximity Tag Reader
- Web interface via optional PowerLink module
- SMS commands via optional GSM/GPRS module
- Remote control by telephone
Display: Single line, Backlit 16-character LCD.
Arming Modes: AWAY, HOME, AWAY-INSTANT, HOME-INSTANT, LATCHKEY, FORCED, BYPASS.
Alarm inhibited during a single arming period (swinger stop) after: 1, 2, 3, alarm/tamper/fault, or not inhibited (programmable / selectable).
Alarm Types: Silent alarm, siren alarm or sounder (internal) alarm, in accordance with zone attributes.
Siren Signals: Continuous (intrusion / 24 hours / panic); triple pulse - pause - triple pulse... (fire).
Siren (bell) Timeout: Programmable
Internal Sounder Output: At least 85 dBA at 10 ft (3 m)
Supervision: Programmable time frame for inactivity alert
Special Functions:
- Speech and sound control
- X10 - an international and open industry standard for communication among electronic devices used for home automation (up to fifteen X-10 units)
- Chime zones
- Diagnostic test and event log
- Local and Remote Programming over Telephone, GSM /GPRS connections

- Calling for help by using an emergency transmitter
- Tracking inactivity of elderly, physically handicapped and infirm people
- Message center (recording and playback)
- Two-way voice communication
Data Retrieval: Status, alarm memory, trouble log.
Real Time Clock (RTC): The control panel keeps and displays time and date. This feature is also used for the log file by providing the date and time of each event. In addition, it is used for the Scheduler where activity of a device is performed according to a specific time and date selection.

Compliance with U.S. Standards:
Meets FCC Part 15 and Part 68 requirements. UL1637, UL1635, UL1023, UL985, ULC-S545-02, ULC C1023, SIA CP01

Compliance with Canadian Standards:
Meets RSS 210, ULC S545-02, ULC C1023, CSA C22.2#205

Compliance with CE Standards:
EN 50131-3, EN501489-3,7, EN 50130-4, EN60950, Aka ETSI TS 0210, ATS-3 En 50131-1, ATS4 (S12) classifications according to EN 50136-1, EN50136-2-1 certified by Telefication

Compliance with UK Standards:
This product is suitable for use in systems installed to conform to PD6662:2010 at Grade 2 and environmental class 2. DD243 and BS8243

According to the European standard EN50131-1, the PowerMaxPro security grading is 2 – "low to medium risk" and environmental classification is II – "indoor general" and the power supply type is A.

GSM standards:
Europe : Complies with CE standards 3GPP TS 51.010-1, EN 301 511, EN301489-7
USA: FCC 47 Part 22 (GSM850) and Part 24 (GSM 1900).
SAR standards: FCC rule 2.1093, FCC Docket 96-326 & Supplement C to OET Bulletin 65
2.2 RF Section
Operating Frequencies (MHz): 315, 433 or 868.95
Receiver Type: Super-heterodyne, fixed frequency
Receiver Range: 600 ft (180 m) in open space
Antenna Type: Spatial diversity
Coding: PowerCode and/or CodeSecure™

2.3 Electrical Data
Power Supply: Internal switching power supply (see Fig. 3.1f), optional external power supply (see section 3.5.6 and Figure 3.1g) 100VAC to 240VAC, 50/60 Hz, 0.5A / 12.5 VDC, 1.6A.

Maximum Output Ripple: 5%
Current Drain: Approx. 40 mA standby, 1400 mA at full load and in alarm.
Site External Siren Current (EXT): 450* mA max @ 10.5 VDC minimum when powered by AC & DC (battery).
Site Internal Siren Current (INT): 450* mA max. @ 10.5 VDC minimum when powered by AC & DC (battery)

PGM Output Current: 100* mA max.
Wired Detectors (zones 29 & 30) Total (Sum) Current: 450* mA max.

High Current / Short Circuit Protection: All outputs are protected (automatic reset fuse).

* Total PowerMaxPro output current (of INT & EXT sirens, PGM output and detectors) cannot exceed 550 mA.

1 Devices that are connected between +12 / V+ terminal and GND of PowerMaxPro, that includes internal GSM and proximity reader.
2 9.6V 1800 mAh, rechargeable NiMH battery pack, p/n GP180AAM8YM, manufactured by GP.
3 9.6V 2200 mAh, rechargeable NiMH battery pack, p/n GP220AAB8BMX, manufactured by GP.
4 Standard / UL installation
5 Extended backup installation

Maximum battery recharge time: 72 hours
Battery Test: Once every 10 seconds.

2.4 Communication
Built-in Modem: 300 baud, Bell 103 protocol
Data Transfer to Local Computer: Via RS232 serial port
Report Destinations: 2 central stations, 4 private telephones.

Reporting Format Options: SIA, Pulse 4/2 1900/1400 Hz, Pulse 4/2 1800/2300 Hz, Contact ID, Scancom.

Pulse Rate: 10, 20, 33 and 40 pps - programmable

Message to Private Phones: Tone or voice

2.5 Physical Properties
Operating Temp. Range: 14°F to 120°F (-10°C to 49°C)
Storage Temp. Range: -4°F to 140°F (-20°C to 60°C)
Humidity: 85% relative humidity, @ 30°C (86°F)
Size: 10-13/16 in. x 8 1/4 in. x 2 1/8 in. (275 x 203 x 55 mm)
Weight: 990g (2.2 pounds) without batteries
Color: Silver or white

3. INSTALLATION

Note: The system must be installed in accordance with Chapter 2 of the National Fire Alarm Code, ANSI/NFPA 72.

3.1 Unpacking the Equipment
Open the cardboard packing box and check whether all items have been included. If you find out that an item is missing, contact your vendor or dealer immediately.

3.2 Supplying Power to the Unit
Connect power to the PowerMaxPro as described in Figure 3.1f for internal power supply or in Figure 3.1g for external power supply. Alternatively, you may power up from the backup battery, as shown in Figure 3.1h.
Disregard any “trouble” indications pertaining to lack of battery or lack of telephone line connection.

For Europe Safety Compliance:

a. The model shall be installed according to the local electrical code.
b. The circuit breaker shall be readily accessible.
c. The rating of the external circuit breaker shall be 16A or less.

d. The cables for the AC mains connection shall have an overall diameter of 13mm and 16mm conduit. Please refer to “Back Unit Power Cable Connection” in Figure 3.1f.

3.3 System Planning & Programming
It pays to plan ahead - use the tables in appendices A and B at the end of this guide to register the intended location of each detector, the holder and assignment of each transmitter and the control plan for the X-10 units. Gather up all transmitters and detectors used in the system and mark each one in accordance with your deployment plan.

Program the system now as instructed in the programming section.

3.4 Mounting
Required tool: Philips screwdriver #2.
PowerMaxPro mounting process is shown in Figure 3.1a - 3.1k.
3.5 Back Unit Mounting and Wiring

Required tools: Cutter and slotted screwdriver - 3 mm blade.

PowerMaxPro wiring is shown in Figures 3.1b and c.

**Figure 3.1a – Back Unit Mounting**

1. Release screws
2. Separate the back unit from the front unit
3. Position the back unit on the desired mounting location and mark 5 drilling points on mounting surface
4. Drill 5 holes and insert wall anchors
5. Fasten the back unit with 5 screws

3.5.1 Phone Wiring

**PHONE WIRING USING RJ CONNECTORS**

1. Connect the receptacles of supplied flat cables (2 - 5 cables according to options) to the back unit’s plugs. The receptacles with strain relief clip are for the front unit - do not connect to the back unit!

For all countries except north America: Connect telephone cable to SET connector and telephone line cable to LINE connector (through the desired wiring cable entry).
3.5.2 Zones and Sirens Wiring

Notes:
* Zone 29/GND and Zone 30/GND terminals can be connected to a normally closed contact of a detector, switch (for example a Tamper switch of any device), or a pushbutton, via a 2.2 KΩ resistor. The 12V terminal can be used to supply 12V (up to 450mA) to wired detectors (if necessary).

** Both +12V terminals are identical (shorted together).
The EXT terminal can be used to trigger an external siren.
The INT terminal can be programmed for an “internal siren” or “strobe” (see DEFINE OUTPUTS - DEFINE INT/STRB in par. 4.8).
The +12V and “GND” terminals can be connected to a siren (for constant DC power supply) – not applicable in North America.

IMPORTANT! Total PowerMaxPro output current (of INT & EXT sirens, PGM output and detectors) cannot exceed 550 mA.

3.5.3 Installing an Optional X-10 Siren

If you need a “wireless” external siren, you may install an X-10 siren module which is triggered by a signal transmitted via the built-in electrical wiring of the protected site. This siren can replace the regular external siren or complement it without laying out additional wires. Of course, such a siren can be used only in conjunction with an optional power-line interface module.

The X-10 siren is ready to function upon connection to an electrical power outlet, without re-programming the PowerMaxPro. You only have to set the HOUSE CODE and the UNIT CODE selectors on the X-10 siren as follows:

House Code: Set this selector to the letter that follows, by alphabetical order, the letter that you programmed as a house code for the protected premises. For example, if the programmed house code is "J", set the siren house code selector to "K".

Note: If the programmed house code letter is "P" (which is the last programmable letter), select "A" for the siren.

Unit Code: The siren will function only if you set the unit code selector to "1".

Figure 3.1b – Phone Wiring

Phone wiring in the UK: Line terminals must be connected to pins 2 and 5 of the wall jack.

For all installations: If DSL service is present on the phone line, you must route the phone line through a DSL filter (refer to MESSAGE TO THE INSTALLER on page 2 for further details).

Figure 3.1c – Zones and Sirens Wiring
3.5.4 Dual RS-232 Module Mounting
The control panel can be equipped with an optional dual RS-232 module for serial data interchange with a local computer (see Figure 3.1d). The dual RS-232 module permits any two simultaneous device connections such as: internal PowerLink, Local PC programming, and External GSM module.

**WARNING!** When an Internal GSM module is connected, the CELL/PC port of the Dual RS-232 module cannot be used for PC connection. In this case, either remove the Internal GSM or use the PL/PC connector.

![Figure 3.1d - Connecting to a Computer](image)

**3.5.5 Audio Module Mounting**
The Audio module allows the connection of an external wired Speech box module. The Speech Box is a wired remote speaker and microphone sensor for indoor use, which provides remote audio capability to enable two-way voice communication, between the user and the central station or private telephone, via the PowerMaxPro control panel.

Press the dual RS-232 and AUDIO modules into the marked locations (see Figure 3.1e), until a click is heard.

![Figure 3.1e - Other Optional Modules Mounting](image)

**3.5.6 Power Cable Connection**
Connect the power cable and close the control panel as shown in Figure 3.1f. Socket-outlet shall be installed near the equipment and shall be easily accessible.

The connection of the power supply to the PowerMaxPro unit can be performed through two options, as follows:
- Through connection of the power cable to the internal power supply, as shown in Figure 3.1f.
- Through direct connection of the 12.5 VDC power supply to the expander card via the wall mounted switched AC/DC power supply (supplied by Visonic), as shown in Figure 3.1g.

![Figure 3.1f - Back Unit Power Cable Connection](image)

a) Insert the power cable through the desired wiring channel (see step 1) and route it to the power supply unit.
b) Pull out the power supply safety cover.
c) Connect the two wires of the power cable to the power supply terminal block with screwdriver.
d) Verify that the wires are tightly fastened by the screws of the terminal block.
e) Fasten the power cable by its clamp (see also step 2 - this clamp can be reversed to fit thick/thin cable)
f) Close the safety cover.
3.6 Front Unit Preparation

3.6.1 Backup Battery Insertion
Open battery compartment cover (see Figure 3.1h). Insert one 8-battery pack and connect its connector to the PowerMaxPro receptacle.

For optional two 8-battery packs: Insert both battery packs and connect one battery pack connector to either receptacles and the second battery pack connector to the other receptacle.

3.6.2 X-10 Interface Module Connection
Connect the X-10 interface module connector to the PowerMaxPro receptacle. Route the cable through the cable channel and connect to the X-10 interface module, via the back unit.

The X-10 jumper should be in 1-W position (for 1-way power line interface unit) or 2-W position (for 2-way power line interface unit).

3.6.3 Optional GSM/GPRS Module Mounting

Caution! Do not insert or remove the GSM module when the PowerMaxPro is powered by AC power or by battery.

Note: Refer to the PowerMaxPro GSM 350 Installation Instructions.

1. Align the two slots of the GSM Module with the two leads on the front unit

2. Push downward on the GSM Module to make sure that the pins of the GSM Module are connected firmly with its connector

3. Fasten the GSM Module with the screw
3.7 Final Closure

1. Before inserting SIM card, deactivate its PIN code (by using a cellular telephone).
2. Do not insert or remove SIM card when the PowerMax Pro is Powered by AC power or battery.

Figure 3.1j - Optional GSM/GPRS Module Mounting

Connect the flat cables to their respective connectors (2 - 5, according to options).

Figure 3.1k - Final Closure

1. Close the panel and fasten the 2 screws.
4. PROGRAMMING

4.1 INTRODUCTION
Your system is equipped with a partitioning feature (in a PowerMaxPro Partition system) that can divide your alarm system into three distinct areas identified as Partition 1 through 3. Partitioning can be used in installations where shared security systems are more practical, such as a home office or warehouse building. When partitioned, each zone, each user code and many of your system's features can be assigned toPartition 1 through 3.

Note: When partition is disabled, all zones, user codes, and features of the PowerMaxPro will operate as in a regular unit. When partition is enabled, all zones, user codes, and features of the PowerMaxPro are automatically assigned to Partition 1.

4.1.1 General Guidance
We recommend to program the PowerMaxPro on the work bench before actual installation. Operating power may be obtained from the backup battery or from the AC power supply. The installer's menu is accessible only to those who know the installer’s 4-digit code, which is 9999 by factory default.

Note: Access to the installer menu, in PowerMaxPro that has “User Permission” enabled (for example in UK) is accessible only at the end of the user menu. This option can be changed if necessary (see par. 4.4.36). For PowerMaxPro that has 2 installer codes, the default MASTER INSTALLER code is 9999 and the default INSTALLER code is 8888.

The following actions can be done only by using the master installer code:
- Changing master installer code.
- Resetting the PowerMaxPro parameters to the default parameters.
- Defining specific communication parameters, as detailed in a note in Figure 4.5.

Obviously, you are expected to use this code only once for gaining initial access, and replace it with a secret code known only to yourself.

You will mainly use 5 control pushbuttons during the entire programming process:

- To move one step forward in a menu.
- To move one step backward in a menu.
- To enter the relevant menu or confirm data.
- To move one level up in a menu.
- To return to the “OK TO EXIT” state.

The sounds you will hear while programming are:
- Single beep, heard whenever a key is pressed.
- Double beep, indicates automatic return to the normal operating mode (by timeout).
- Happy Melody (-----), indicates successful completion of an operation.
- Sad Melody (-----), indicates a wrong move or rejection.

4.1.2 Entering an Invalid Installer Code
If you enter an invalid installer code 5 times, the keypad will be automatically disabled for a pre-defined period of time and the message WRONG PASSWORD will be displayed.

4.1.3 Installer's Menu
The installer's menu is shown in Figure 4.1a. The text in rectangles represents the current PowerMaxPro display.

4.1.4 Setting a New Installer Code
To set an installer code, perform the actions that are presented in Figure 4.1b. When you are instructed to enter code, enter a 4-digit code.

4.1.5 Setting a New Installer Code in PowerMaxPro that has 2 Installer Codes
For PowerMaxPro with 2 installer codes, MASTER INSTALLER code (default 9999) and INSTALLER code (default 8888), set new codes as shown in figure 4.1c. For details regarding the different authorization levels when logging in with installer code and master installer code, refer to the note inside Figure 4.5 (DEFINE COMM). By using the master installer code, the menu enables changing both master installer code and installer code. By using the installer code, the menu enables changing the installer code only.

(*) Applicable only when "USER PERMIT" function is enabled (see par. 4.4.36 - USER PERMIT).

Figure 4.1a - Installer's Menu
4.2 ENROLLING WIRELESS SENSORS AND KEYFOB TRANSMITTERS

4.2.1 General Guidance
The ENROLLING mode has the following sub-modes:

- ENROLLING TYPE (wireless sensors)
- ENROLL SENSORS (enroll wired magnetic contact or any other contact in zones 29 & 30 / enroll wireless detectors in zones 01-28).
- ENROLL KEYFOB (multi-button CodeSecure transmitters)
- ENROLL WL 1WAY KP (wireless commander MCM-140+)
- ENROLL WL LCD KP (wireless 2-way keypad MKP-150/151/152 or wireless 2-way keyprox MKP-160)
- ENROLL WL SIREN (wireless siren)
- ENROLL PROX TAG (proximity tag)

Before beginning, gather all the sensors that you intend to enroll and make sure they all have batteries installed.
Your control panel must recognize the unique identification code (ID) of each such sensor in order to supervise them, receive their signals and respond accordingly.

**Attention!** CodeSecure transmitters are mainly used for arming/disarming and can not be enrolled to zones. For enrolling to zones, use only non-CodeSecure wireless sensors.

4.2.2 Enrolling Type
Here you determine whether to enroll a wireless sensor by normal transmission or by sensor Tamper function (opening its cover). Options: normal, or by tamper.

4.2.3 Enroll/Delete Sensors
Wired and wireless sensors can be enrolled into the PowerMaxPro. To enroll / delete sensors, refer to Figure 4.2.

- Before enrolling, the lens at the front of PIR and dual-technology sensors should be masked to prevent inadvertent transmission.
- Make sure that magnetic contact transmitters are together with their magnets, to prevent them from sending out alarm transmissions.

4.2.4 Enroll/Delete Keyfob Transmitters
Keyfob transmitters are multi-button wireless CodeSecure™ transmitters. Eight system users use them for better, quicker and safer control over various system functions.

To enroll / delete 1-way or 2-way keyfob transmitters, refer to Figure 4.2.

4.2.5 Enroll/Delete Wireless Commander
The Wireless Commander (MCM-140+) is a remote control unit that enables the user to remotely control the system.

To enroll / delete up to 8 wireless commanders, refer to Figure 4.2 (Enroll WL 1-way KP).

4.2.6 Enroll/Delete 2-Way Keypad / Keyprox
The 2-way keypad, type MKP-150/151/MKP-152, or 2-way keyprox, type MKP-160, enables the user to remotely control the system and also to receive data from the system (status, alarm and trouble data). To enroll up to two 2-way keypads, refer to Figure 4.2.

4.2.7 Enroll/Delete Wireless Siren
The wireless siren is a remote siren that is activated upon predefined events by the PowerMaxPro system. To enroll / delete up to 2 wireless sirens, refer to Figure 4.2.

4.2.8 Enroll/Delete Proximity Tags
Proximity tags enable authorized people to enter restricted areas. Presenting valid proximity tag, while the system is armed, causes the system to disarm. Presenting valid proximity tag, while the system is disarmed, causes the system to be armed in AWAY (optional HOME) mode. To enroll / delete proximity tags, refer to Figure 4.2.

**Note:** Proximity tags are used on control panels with installed Proximity readers (not standard on UK versions).
Figure 4.2 - Enrolling / Deleting Wireless Sensors / Keyfobs / Wireless Commanders / Wireless Sirens

* Keyfob & proximity tags enrolling can be performed by the installer or by the user (via USER SETTINGS menu).

** Black box in the display means that a device is enrolled (the system has learned its ID). No black box indicates that the device is not enrolled.

*** Initiate either normal transmission or the sensor tamper function (see ENROLLING TYPE, Par. 4.2.2).

Note: This changes the RF range during enrolling only and does not affect the performance of the sensor.

**** Select "higher" sensitivity for far wireless sensor, "lower" for near sensors.
4.3 DEFINING ZONE TYPES, NAMES, CHIME ZONES & PARTITION

This mode allows you to assign one of 15 zone types to each of the system's 30 (wireless & wired) zones. You can define zones as KEY ZONES, to enable arming/disarming of the system by PowerCode transmitters (see appendix D14). In addition, it also allows you to assign a name and partition number (up to three) to each zone and determine whether the zone will operate as a chime zone. When a chime zone is triggered, chime melody or zone name is heard (there are 3 selectable chime modes - Melody chime, Zone Name Chime or Chime Off).

A list of factory defaults is printed in table 1. You may fill out the blank columns even before you start and proceed to program according to your own list.

**Remember!**
A delay zone is also a perimeter zone by definition.
Zone types are fully explained in Appendix D.
Note: Custom Zone Name text can be changed through the DEFINE VOICE menu.

![Figure 4.3 - DEFINE ZONES Flow Chart](image)

* The currently saved option is displayed with a dark box at the right side. To review the options, repeatedly click or button, until the desired option is displayed, then click (a dark box will be displayed at the right side).

** Key ON/OFF is an optional function that enables you to arm or disarm the system via zones 21-28, 29 or 21-29, provided that "non-alarm" was pre-defined for these zones.
Before enabling Key Zones, the following procedures must be performed:
1. Go to the "2. ENROLLING" menu and enroll the transmitter (for further instructions, see section 4.2).
2. Go to the "4. DEFINE PANEL" menu and enter the "39. KEY ZONES OPT" sub-menu. Then, select the desired Key Zone option. After making your selection, press the button on the keypad (for further instructions, see section 4.4).

*** Available and enabled only by customer request.

**** Zone Type Definitions:
- Inter-follow – a zone that is located between entry/exit zone and the alarm system control panel
- Perimeter – a zone that relies on detectors to protect doors, windows and walls
- Perim-follow – a non-entry/exit zone
- Delay 1/2 – a zone that has programmable exit and entry delays
- 24h silent – a zone that initiates a silent alarm (the sirens do not function)
- 24h audible – a zone that initiates a siren alarm
- Fire – a zone that uses smoke detectors and is permanently active
- Non-alarm – used mainly to perform auxiliary remote control tasks such as opening/closing a gate, activating/deactivating courtesy light, etc.
- Emergency – used to send an emergency call to the central station or to private telephones
- Gas – a zone that detects a gas leak and is permanently active
- Flood – a zone that detects a flood leak and is permanently active
- Interior – a zone that allows free movement within the protected area without initiating an alarm (when armed HOME)
- Temperature – a zone used to detect both indoor and outdoor temperatures and is permanently active
- Home/Delay – a zone type which functions as a delay zone when the system is armed HOME and as a perimeter-follower zone when the system is armed AWAY
- Guard – a zone that functions like a 24-hour audible zone, except that following a short time period after an alarm, the alarm is disabled (to allow access to a metal safe by a Guard)
- Outdoor – a zone for outdoor areas where an activated alarm does not indicate intrusion into the house

For a detailed explanation of the Zone Types, refer to Appendix E.

4.4 DEFINING CONTROL PANEL PARAMETERS

4.4.1 Preliminary Guidance
This mode allows you to customize the control panel and adapt its characteristics and behavior to the requirements of the particular user. An illustrated process is shown in Figure 4.4. In this illustration, each selected option is displayed with a dark box at the right side. To review the options, repeatedly click or button, until the desired option is displayed, then click SHOW/OK button.

4.4.2 Entry Delays 1&2
(Fig. 4.4, location 01, 02). Two different entry delays allow the user to enter the protected site (while the system is in the armed state) via 2 specific doors and routes without causing an alarm.

Following entry, the user must disarm the control panel before the entry delay expires. Slow-rate warning beeps start sounding once the door is opened, until the last 10 seconds of the delay, during which the beeping rate increases. Locations No. 1 (entry delay 1) and 2 (entry delay 2) allow you to program the length of these delays.

Available options for each delay are: 30s, 60s, 90s, 120s, 3m, and 4m.

4.4.3 Exit Delay
(Fig. 4.4 location 03). An exit delay allows the user to arm the system and leave the protected site via specific routes and doors without causing an alarm. Slow-rate warning beeps start sounding once thearming command has been given, until the last 10 seconds of the delay, during which the beeping rate increases. Location No. 3 allows programming of the exit delay length. Available options are: 30s, 60s, 90s, 120s, 3m, and 4m.

4.4.4 Bell Time
(Fig. 4.4, location 04). Here you select the length of time the bell (or siren) is allowed to function upon alarm. The bell time starts upon activation of the siren. Once the bell time expires, the siren is automatically shut down.

Available options are: 1, 3, 4, 8, 10, 15 and 20 minutes.

Note: Bell Time is defined for the entire alarm system and not per partition.

4.4.5 Abort Time
(Fig. 4.4 location 05). Here you select the length of time allowed by the system to abort an alarm (not applicable to alarms from FIRE, 24H SILENT, EMERGENCY, GAS, FLOOD and TEMPERATURE zones). The PowerMaxPro is programmed to provide an “abort interval” that starts upon detection of an event. During this interval, the buzzer sounds a warning but the siren remains inactive and the alarm is not reported. If the user disarms the system within the allowed abort interval, the alarm is aborted.

Available options are: 00s, 15s, 30s, 45s, 60s, 2m, 3m and 4m.

4.4.6 Alarm Cancel
(Fig. 4.4, location 06). Here you determine the “cancel alarm” period that starts upon reporting an alarm to the central station. If the user disarms the system within that time period, a “cancel alarm” message is sent to the central station.

Available options are: 1, 5, 15, 60 minutes, 4 hours and also cancel inactive.

4.4.7 Quick Arm
(Fig. 4.4, location 07). Here you determine whether the user will be allowed to perform quick arming or not. Once quick arming is permitted, the control panel does not request a user code before it arms the system.

The two options are: quick arm ON and quick arm OFF.
4.4.8 Bypass
(Fig. 4.4, location 08). Here you permit either manual bypassing of individual zones (through the USER SETTINGS menu), or allow the system to "force arm" (perform automatic bypassing) of open zones during the exit delay. If desired, press the arming key again if you want to eliminate the protest tone that sounds during forced arming. If a zone is open and forced arming is not permitted, "NOT READY" is displayed and the system does not arm (the "Sad Melody" will sound). If "no bypass" is selected, neither manual bypassing nor force arming is allowed.

Options: manual bypass, force arm and no bypass.
Note: Force arm is not applicable in the UK.

4.4.9 Exit Mode
(Fig. 4.4, location 09). Here you determine exit mode options. Three types of exit modes are available:
- **Restart Exit** - Exit delay restarts when the door is reopened during exit delay. The restart occurs once only. Restarting the exit delay is helpful if the user re-enters immediately after going out to retrieve an item that he left behind.
- **Off by door** - When the door is closed, the exit delay is automatically terminated (even if the defined exit delay was not completed).
- **Normal** - The exit delay is exactly as defined, regardless of whether the door is open or closed.

4.4.10 Piezo Beeps
(Fig. 4.4, location 10). Here you determine whether warning beeps will sound or muted during exit and entry delays. Additional options enable muting only the warning beeps when the system is armed "HOME" or "AWAY". In addition, during arming home the system arms in silence, however, once armed, triggering a delay zone will activate the entry beeps prompting the user to disarm the system.

Options (Partition disabled): enable beeps, off when home, disable beeps, and off exit home.
Options (Partition enabled): ㅁ, ㅁ, ㅁ (enable beeps), H (off when home) and ㅁ, ㅁ (disable beeps) and H (off exit home). The pushbuttons 1, 2, 3, and ㅁ provide selection of the corresponding partitions. Pressing each button repeatedly will toggle between each option.

Note: When exit beeps are disabled toward the end of a delay, the happy (success) melody will sound.

4.4.11 Trouble Beeps
(Fig. 4.4, location 11). Under trouble conditions, the sounder emits a series of 3 short beeps once per minute. Here you determine whether this special beeping sequence will be active, inactive, or just inactive at night (the range of "night" hours is defined in the factory). The 3 options are: enable beeps, off at night (8 PM through 7 AM) and disable beeps.

4.4.12 Panic Alarm
(Fig. 4.4, location 12). Here you determine whether the user will be allowed to initiate a panic alarm by simultaneous pressing either the two panic buttons (on the keypad / wireless commander) or away + home (on a keyfob transmitter). Audible panic activates the siren and simultaneously transmits a message via telephone. Silent panic only transmits a message via telephone. The options are: silent panic, audible panic and disable panic.

4.4.13 Swinger Stop
(Fig. 4.4, location 13). Here you determine the number of times each zone is allowed to initiate an alarm within a single arming period (including tamper & power failure events of detectors, PowerMaxPro, wireless sirens, etc.). If the alarms number from a specific zone exceeds the programmed number, the control panel automatically bypasses the zone to prevent recurrent siren noise and nuisance reporting to the central station. The zone will be reactivated upon disarming, or 48 hours after having been bypassed (if the system remains armed).

Available options are: shut after 1, shut after 2, shut after 3 and no shutdown.

Note: Swinger Stop is defined for the entire alarm system and not per partition.

4.4.14 Cross Zoning
(Fig. 4.4, location 14). Here you determine whether cross zoning will be active or inactive. Cross zoning is a method used to counteract false alarms - an alarm will not be initiated unless two adjacent zones are violated within a 30-second time limit.

This feature is active only when arming AWAY and only with zone couples from zone No. 18 to 27 (18 and 19, 20 and 21, etc.). You may use any one of these zone couples to create a "cross-zoned" area.

Note: If one of two crossed zones is bypassed (see Para. 4.4.8), the remaining zone will function independently.

Note: Every 2 crossed zones must be of the allowed zone type (Interior, Perimeter, Perimeter follower). The options are: cross zone ON and cross zone OFF.

Note: A common zone should not be defined as a cross zone.

Cross zoning is not applicable in Entry/ Exit zones and 24h zones (Fire, Emergency, 24h audible, 24h silent).

4.4.15 Supervision
(Fig. 4.4, location 15). Here you determine the time limit for reception of supervision reports from various supervised wireless devices. If any device does not report at least once within the selected time limit, an "INACTIVITY" alert is initiated.

The options are: 1, 2, 4, 8, 12 hours and disable.

4.4.16 NOT READY
(Fig. 4.4, location 16). Here you determine if the system will be in NOT READY status when there is a supervision failure. In the "in supervision" mode, the system will be in NOT READY status if during the last 20 minutes a supervision message was not received. Options: normal and in supervision.

4.4.17 AUX Button A
(Fig. 4.4, location 17). Here you select the function of the AUX button A on keyfob transmitters MCT-234, MCT-237 and wireless commanders MCM-140+. Four options are offered for each AUX button:

- **Status**: Pressing the AUX button will cause the control panel's voice module to announce the system status.
- **Instant**: Pressing the AUX button while the exit delay is in progress will cause the system to arm "instant" (the entry delay is canceled).
- **Skip exit delay**: Pressing the AUX button will immediately cause the system to arm "instant".
- **PGM / X-10**: Pressing the AUX button will activate the PGM output or X-10 units (see further programming under "DEFINE OUTPUTS", par. 4.8).
**4.4.18 AUX Button B 2-W-KF**
(Fig. 4.4, loc. 18). Applicable only for 2-way keyfob MCT-237. Same as 4.4.17 but for AUX button B.

**4.4.19 Jam Detect**
(Fig. 4.4, location 19). Here you determine whether jamming (interfering transmissions, on the radio channel used by the system) will be detected and reported or not. If a jam detection option is selected, the system does not allow arming under the relevant jamming conditions.

**Jam Detection Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Detection and Reporting when</th>
</tr>
</thead>
<tbody>
<tr>
<td>UL (20/20) (USA standard)</td>
<td>There is continuous 20 seconds of jamming</td>
</tr>
<tr>
<td>EN (30/60) (Europe standard)</td>
<td>There is an accumulated 30 seconds of jamming within 60 sec.</td>
</tr>
<tr>
<td>class 6 (30/60) (British standard)</td>
<td>Like EN (30/60) but the event will be reported only if the jamming duration exceeds 5 minutes.</td>
</tr>
<tr>
<td>Disabled</td>
<td>(no jamming detection and reporting)</td>
</tr>
</tbody>
</table>

**4.4.20 Latchkey**
(Fig. 4.4, location 20). Here you determine whether the system can be armed in the latchkey mode. If the system is armed this way, a “latchkey” message will be sent to specific telephones upon disarming by a “latchkey user” (users 5-8 or keyfob transmitters 5-8). This mode is useful when parents at work want to be informed of a child’s return from school. You can record a name for latchkey users. The options are: Latchkey ON and Latchkey OFF.

**4.4.21 “Not Active”**
(Fig. 4.4, location 21). Here you determine the time limit for reception of signals from sensors used to monitor the activity of sick, elderly or disabled people. If no sensor detects and reports movement at least once within the defined time limit, a “not-active” alert is initiated.

Options: 3, 6, 12, 24, 48, 72 hours and no act disable.

**4.4.22 Back Light**
(Fig. 4.4, location 22). Here you determine whether the keypad backlighting will remain on at all times or will come on when a key is pressed and go off within 10 seconds if no further keystrokes are sensed.

The two options are: always on and off after 10 s.

**4.4.23 Duress**
(Fig. 4.4, loc. 23). A duress alarm (ambush) message can be sent to the central station if the user is forced to disarm the system under violence or menace. To initiate a duress message, the user must disarm the system with the duress code (2580 by default). Here you can change the code digits or enter “0000” to disable the duress feature. The system does not allow the user to program the duress code saved in this memory location as an existing user code.

**4.4.24 Piezo Siren**
(Fig. 4.4, location 24). Here you determine whether the internal siren will sound or remain silent upon alarm (according to the user preference). Options: piezo siren on, piezo siren off.

**4.4.25 Reset Option**
(Fig. 4.4, location 25). *(Not applicable in the USA)*

Here you determine whether the system can be rearmed (after an event) by the user or only by the installer.

Options: user reset or engineer reset or anti code reset.

If Engineer Reset is selected, the system can be rearmed only by the installer; by entering and exiting the installer menu, by entering and exiting the event log (see section 7), or by remote telephone. To perform Engineer Reset via the telephone, establish communication with the PowerMaxPro (see user guide, Remote Control by Telephone, steps 1-5) and continue as follows:

a. + [*], [installer code], [#]
b. Wait for 2 beeps
c. + [*], [1], [#]
d. + [*], [99], [#]

Visonic uses Technistore anti code reset. Installers should check with their central station for a code version (seed code) which needs to be entered in menu 4.4.35.

**4.4.26 Tamper Option**
(Fig. 4.4, location 26). Here you determine whether zone tamper will be reported or ignored. Available options are: zone tamper ON and zone tamper OFF.

**4.4.27 Siren On Line**
(Fig. 4.4, location 27). Here you determine whether the siren will be activated or not when the telephone line fails during system armed state. Available options are: enable on fail, disable on fail.

**4.4.28 Memory Prompt**
(Fig. 4.4, location 28). Here you determine whether the user will receive indication that an alarm has been activated. Available options are: enable and disable.

**4.4.29 Disarm Option**
(Fig. 4.4, location 29) *(Not applicable in the USA)*

Here you determine when it is possible to disarm the system:

A. Any time.
B. In AWAY mode, during entry delay, by using the PowerMaxPro keypad or wireless device (keyfob).
C. In AWAY mode, during entry delay, by using a wireless device (keyfob) only (this is set as a default in UK to comply with DD423).
D. During entry delay, or by using the PowerMaxPro keypad in AWAY mode. Options: any time, on entry all, on entry wireless, or entry + away kp.

**4.4.30 Bell/Rep. Option**
(Fig. 4.4, location 30). Here you determine whether an alarm will be initiated (siren / report) when there is a supervision / jamming failure during AWAY arming state. Available options are: EN standard and other. When “EN standard” is selected, if there is supervision / jamming failure during AWAY arming, the siren is activated and the events are reported as tamper events. When “Other” is selected, there is no such activity during AWAY arming.

**4.4.31 Low-Bat Ack**
(Fig. 4.4, location 31). Here you determine whether the user will hear or will not hear low battery sound when he tries to disarm the system with a keyfob whose battery voltage is low. Available options are: keyfob L-B on (the user has to acknowledge the keyfob low battery message) or keyfob L-B off (the user does not have to acknowledge the keyfob low battery message).

**4.4.32 Screen Saver**
(Fig. 4.4, location 32). Here you can determine that if no key is pressed during more than 30 seconds the display will read “PowerMax” (to prevent a possible intruder of knowing the system status). You can determine that normal display will return after pressing the button followed by entering user code (Refresh by Code/Text by Code) or after pressing any key (Refresh by Key/Text by Key). When partition is enabled, you can also determine that if no key is pressed during more than 30 seconds the date and time will appear on the display. You can determine that normal display will return after pressing the button followed by entering user code (Clock by Code) or after pressing any key (Clock by Key).
If **Refresh by Key/Text by Key** is selected, the first pressing of any key (except Fire and Emergency) will cause normal display return and the second press will perform the key function. Regarding the Fire and Emergency keys, the first key press will cause normal display return and also will perform the Fire/Emergency function.

Options (Partition Disabled): **scrn saver OFF, refresh by code, refresh by key.**
Options (Partition Enabled): **scrn saver OFF, text by code, text by key, clock by code, clock by key.**

### 4.4.33 Confirm Alarm
(Fig. 4.4, location 33). Here you determine that if 2 successive alarms will occur during a specific period, the second alarm will be considered as a **confirmed alarm** (for confirmed alarm reporting, (see par. 4.5.3)).
Options: **disable 30 min., 45 min., 60 min., or 90 min.**

### 4.4.34 AC FAIL REP
(Fig. 4.4, location 34). Here you determine the time interval between AC power failure occurrence and the failure reporting. Options: **5 minutes, 30 minutes, 60 minutes** or **180 minutes.**

### 4.4.36 User Permission
(Fig. 4.4, location 36). Here you determine whether the access to the INSTALLER MODE requires user permission. If you select **ENABLE,** the installer mode will be accessible only through the user menu after entering the user code.
Options: **Enable, Disable.**

### 4.4.38 Battery Type
(Fig. 4.4, location 38). Here you determine which type of battery pack is used, so that the system will supply proper charge current.
Options: **7.2V** or **9.6V.**

### 4.4.39 Key Zones Options (Optional)
(Fig. 4.4, location 39). Here you determine whether or not the system can be armed and disarmed by zones 21-28, 29-30 or 21-30, provided that for these zones "non-alarm type" and "z-key enable" was predefined (see par. 4.3 and Appendix D14).

**Key zones can be wireless or wired zones.**

When using wireless key zones, you can install and use the following transmitters:
- MCT-100
- MCT-102
- MCT-302
- MCT-320

When using wireless key zones, only the MCT-100 and MCT-102 transmitters are used. The right pushbutton on the MCT-102 transmitter or input 2 of the MCT-100 transmitter is used for arming in AWAY mode. The left pushbutton on the MCT-102 transmitter or input 1 of the MCT-100 transmitter is used for disarming.

When using wired key zones an open circuit arms the alarm system in AWAY mode and a closed circuit changes the state of the alarm system from AWAY mode to Disarm. (For information on how to connect to wired key zones, see Fig. 3.1C Zones and Sirens Wiring.)

**IMPORTANT!** Enrolment of the MCT-100 or MCT-102 transmitter must be performed via the right pushbutton on the MCT-102 transmitter or input 2 of the MCT-100 transmitter (see section 4.3).

If the area includes MCT-302 and MCT-320 transmitters, a closed circuit (the magnet is placed near the transmitter) arms the alarm system in AWAY mode and an open circuit (the magnet is moved away from the transmitter) changes the state from AWAY mode to DISARM.

**Note:** Key Zones does not comply with Belgium TO14A and EN 50131-5-3.

| Options: disable option, z. 21-28 enable, z. 29-30 enable, or z. 21-30 enable. |

**Caution!** Arming the system using a transmitter assigned to zones 21 and 28, or via wired zones 29 and 30 compromises security. This function is, therefore, only available in specific PowerMaxPro versions according to the customer's request.
4.5 DEFINING COMMUNICATION PARAMETERS

Preliminary Guidance
This mode allows you to adapt the telephone communication parameters to the local requirements.

Note: Defining communications via GPRS is applicable to PowerMaxPro versions 5.2.07 and above.

Compatible central station receivers are:

IMPORTANT: In telephone number locations and account number locations, you may be required to enter hexadecimal digits. In telephone number locations, these digits are used as codes to control the dialer:

<table>
<thead>
<tr>
<th>Hex. Digit</th>
<th>Keying Sequence</th>
<th>Code Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>&lt;#&gt; ⇒ &lt;0&gt;</td>
<td>Applicable only at the beginning of a number - the dialer waits 10 seconds or waits for dial tone, whichever comes first and then dials.</td>
</tr>
<tr>
<td>D</td>
<td>&lt;#&gt; ⇒ &lt;3&gt;</td>
<td>Applicable only at the beginning of a number - the dialer waits 5 seconds for dial tone and goes on hook if none is received.</td>
</tr>
<tr>
<td>E</td>
<td>&lt;#&gt; ⇒ &lt;4&gt;</td>
<td>Applicable only in the middle of the number - the dialer waits 5 seconds</td>
</tr>
<tr>
<td>F</td>
<td>&lt;#&gt; ⇒ &lt;5&gt;</td>
<td>Not applicable in phone numbers</td>
</tr>
</tbody>
</table>

Note: A "*" can be entered at the beginning of the line by pressing [7] and then [2].

To enter a series of digits, use the following keys:
<Numeric keypad> - to enter the number
[6] - moves the cursor from left to right
[4] - moves the cursor from right to left
[5] - deletes everything after the cursor (to the right).

4.5.1 PSTN / GSM (Fig. 4.5)

Area Code [Fig 4.5.1(1)]
Here you enter the system tel. area code (up to 4 digits).

Line Prefix [Fig 4.5.1(2)]
Here you enter the number that is used as a prefix to access an outside telephone line (if exists).

Dial Method [Fig 4.5.1(3)]
Here you determine the dialing method used by the automatic dialer built into the PowerMaxPro control panel.
The options are: Pulse and tone (dtmf).

GSM Keep Alive [Fig 4.5.1(4)]
Here you prevent the GSM service provider from disconnecting the GSM line if the user has not initiated any outgoing telephone calls during the last 28 days.
The options are: disable and every 28 days.

Note: A test message is sent to the first available SMS number. If this does not exist then it makes a call to the first private number.

4.5.2 GPRS / BB (Fig. 4.5)
The GSM/GPRS module is capable of communicating with the Central Station receiver by GPRS, GSM Voice and SMS channels. Each of the channels can be separately enabled or disabled in order to allow or prohibit the module from using it for the event reporting. If all channels are enabled, the GSM/GPRS module will always try GPRS first. If fails, it will try GSM Voice. If fails, it will try any other possible method (PSTN, Broadband) and only then it will try SMS. This is due to the fact that SMS is the most unreliable option of communication. Disabling any of the GSM Module channels will cause the module to use a different sequence than the one described above.

GPRS Report [Fig 4.5.2(1)]
Here you determine whether the alarm system will report events to the central station via the GPRS channel.
The options are: disable and enable.

GSM Report [Fig 4.5.2(2)]
Here you determine whether the alarm system will report events to the central station via the GSM voice channel.
The options are: disable and enable.

SMS Report [Fig 4.5.2(3)]
Here you determine whether the alarm system will report events to the central station via the SMS channel.
The options are: disable and enable.

GPRS APN [Fig 4.5.2(4)]
Here you enter the name of the APN (Access Point) used for the internet settings for the GPRS (up to 40 digits).

GPRS Username [Fig 4.5.2(5)]
Here you enter the username of the APN used for GPRS communications (up to 30 digits).

GPRS Password [Fig 4.5.2(6)]
Here you enter the password of the the APN used for GPRS communications (up to 16 digits).
The following table provides a list of the keys used by the PowerMaxPro editor for the GPRS APN, GPRS Username, GPRS Password menus and Custom Zone Name option.

Key | Functionality
--- | ---
Moves the cursor from left to right. Long press for speed.
Moves the cursor from right to left. Long press for speed.
Scrolls upward the sequence of inserted digits. Long press for speed.
Scrolls downward the sequence of inserted digits. Long press for speed.
Places cursor to extreme right position of edit string and shows the last 16 digit of edit string.
Reverts to previous or top menu without saving the edit string.
Reverts to "<OK> TO EXIT" without saving the edit string.
Saves and reverts to previous menu.
Clears all digits to the right of cursor.
Clears one digit by cursor.
Selects between uppercase or lowercase digits.

Note: The "*" digit replaces the "@" digit which is not included in the PowerMaxPro editor.

Antenna Select [Fig 4.5.2(7)]
Here you determine which antenna will be used for the GSM.

Note: Applies to GSM 200 unit only.
The options are: internal antenna or external antenna.

SIM PIN Code [Fig 4.5.2(8)]
Enter PIN code of the SIM card installed in the PowerMaxPro unit (up to 16 digits).

Force Home Network [Fig 4.5.2(9)]
Here you determine whether to force the SIM card to use the home network only and not to select another network in case the home network cannot be found.
The options are: disable and enable.

D-302541 PowerMaxPro Installer's Guide 19
LAN Settings [Fig 4.5.2(10)]
Note: The LAN Settings menu appears only if a Broadband Module exists in the PowerMaxPro alarm system.
Enable DHCP [Fig 4.5.2(10a)]
Here you determine whether to obtain an IP address automatically using a DHCP server or to enter an IP address manually.
Toggles between DHCP enable and DHCP disable.
Note: When DHCP is enabled, the last IP number will be changed to 200. In other words, it will take the form xxx.xxx.xxx.200.
Manual IP [Fig 4.5.2(10b)]
Here you manually enter LAN parameters.
IP address – the IP address of the Broadband Module.
Subnet mask – the subnet mask used with the IP address.
Default GW – the default gateway of the Broadband Module.
Note: If DHCP is set to enabled the above entries will be ignored.

Transport Protocol (Applicable in the USA only) [Fig 4.5.2(11)]
Here you select the type of protocol used by the control panel to transfer data over the internet.
The options are: TCP and UDP.
Session Timeout [Fig 4.5.2(12)]
Here you determine whether the control panel will stay continuously connected via GPRS communication, or, temporarily connected to receive event reports only.
The options are: off on timeout and always ON.

4.5.3 C.S. Reporting (Fig. 4.5)
Report Events [Fig 4.5.3(1)] – see note in Fig. 4.5
Here you determine which types of event will be reported to central stations. Due to lack of space in the display, abbreviations are used: alarm is "alrm", alert is "alrt" and open/close is "o/c". The asterisk (*) is a separator between events reported to central station 1 and events reported to central station 2.
Messages are divided by type into four groups:

<table>
<thead>
<tr>
<th>No.</th>
<th>Group</th>
<th>Events Reported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Alarms</td>
<td>Fire, Burglary, Panic, Tamper</td>
</tr>
<tr>
<td>2</td>
<td>Open/close</td>
<td>Arming AWAY, Arming HOME, Disarming</td>
</tr>
<tr>
<td>3</td>
<td>Alerts</td>
<td>No-activity, Emergency, Latchkey, Gas, Flood, Temperature</td>
</tr>
<tr>
<td>4</td>
<td>Maintenance</td>
<td>Low-battery AC failure</td>
</tr>
</tbody>
</table>

"Alrm" group has the highest priority and "Alert" group has the lowest priority.
The selectable options are as follows:

- **Plan name**
  - All -o/c γ backup
    - All but open/close
    - All but open/close if center 1 doesn’t respond
  - all γ
    - All
  - all -o/c γ
    - All but open/close
    - All but open/close
  - all -o/c γ o/c
    - All but open/close
    - Open/close
  - all (−alrt) γ alrt
    - All but alerts
    - Alerts
  - Alrm γ all (−alrm)
    - Alarms
    - All but alarms
  - Disable report
    - Nothing
  - Nothing
  - all γ backup
    - All
    - All if cent. 1 doesn’t respond

Note: “All” means that all 4 groups are reported and also trouble messages - sensor / system low battery, sensor inactivity, power failure, jamming, communication failure etc.

1st Report Method [Fig 4.5.3(2)]
Here you define the 1st priority of method used to report events.
The options are: disable, cellular, broadband and PSTN.

2nd Report Method [Fig 4.5.3(3)]
Here you define the 2nd priority of method used to report events. If the method defined to report events in the 1st priority fails, the control panel will attempt to report using the method defined in the 2nd priority (see notes in 1st Report Method).
The options are: disable, cellular, broadband and PSTN.

3rd Report Method [Fig 4.5.3(4)]
Here you define the 3rd priority of method used to report events. If the method defined to report events in the 2nd priority fails, the control panel will attempt to report using the method defined in the 3rd priority (see notes in 1st Report Method).
The options are: disable, cellular, broadband and PSTN.

Dual Reporting [Fig 4.5.3(5)]
Here you determine whether to report events using PSTN and cellular at the same time instead of waiting for the 1st method to fail before trying the 2nd method.
The options are: disable, PSTN & broadband, PSTN & cellular and broadband & cell.

Receiver 1 Account No. [Fig 4.5.3(6)] - see note in Fig. 4.5
Here you enter the number that will identify your specific alarm control system to the 1st central station. The number consists of 6 hexadecimal digits.

Receiver 2 Account No. [Fig 4.5.3(7)] - see note in Fig. 4.5
Here you enter the number that will identify your specific alarm control system to the 2nd central station. The account number consists of 6 hexadecimal digits.

PSTN/GSM RCVR1 [Fig 4.5.3(8)] - see note in Fig. 4.5
Here you program telephone number of the 1st central station (including area code, 16 digit max) to which the system will report the event groups defined in Report Events.

PSTN/GSM RCVR2 [Fig 4.5.3(9)] - see note in Fig. 4.5
Here you program telephone number of the 2nd central station (including area code, 16 digit max) to which the system will report the event groups defined in Report Events.

IP RCVR 1 [Fig 4.5.3(10)]
Here you enter the IP address of the IP receiver that is located in the 1st central station.

IP RCVR 2 [Fig 4.5.3(11)]
Here you enter the IP address of the IP receiver that is located in the 2nd central station.

SMS RCVR 1 [Fig 4.5.3(12)]
Here you enter the telephone number of the SMS receiver that is located in the 1st central station.

SMS RCVR 2 [Fig 4.5.3(13)]
Here you enter the telephone number of the SMS receiver that is located in the 2nd central station.

PSTN Report Format [Fig 4.5.3(14)] - see note in Fig. 4.5
Here you select the reporting format used by the control panel to report events to central stations.
The options are: PSTN text Contact-ID PSTN 4/2 1900/1400 4/2 1800/2300 Scancom (see Appendix C - code lists).

4/2 Pulse Rate [Fig 4.5.3(15)] - see note in Fig. 4.5
Here you select the pulse rate at which data will be sent to central stations if any one of the 4/2 formats has been selected in PSTN Report Format.
The options are: 10, 20, 33 and 40 pps.
PSTN Report Retry [Fig 4.5.3(16)] - see note in Fig. 4.5
Here you determine the number of times the communicator will dial the central station’s number via PSTN.
The options are: 2, 4, 8, 12 and 16 attempts.

GSM Report Retry [Fig 4.5.3(17)] - see note in Fig. 4.5
Here you determine the number of times the communicator will try to report via a cellular group (GPRS, GSM and SMS) to the central station.
The options are: 2, 4, 8, 12 and 16 attempts.

LAN Report Retry [Fig 4.5.3(18)] - see note in Fig. 4.5
Here you determine the number of times the communicator will try to report via the Broadband Module communication to the central station.
The options are: 2, 4, 8, 12 and 16 attempts.

Auto Test Time [Fig 4.5.3(19)]
Here you determine the time at which the telephone line will be tested and reported to the central station.

Auto Test Cycle [Fig 4.5.3(20)]
Here you determine the time interval between consecutive telephone line test messages sent to the central station. The control panel performs this at regular intervals to verify proper communications.
The options are: test every 5 hours, test every 1, 2, 5, 7, 14, 30 days and test OFF.

Line Fail Report [Fig 4.5.3(21)]

PSTN [Fig 4.5.3(21a)]
Here you determine if the PSTN telephone line disconnection will be reported or not and determine the delay between detection of line disconnection and the failure reporting. If the telephone line is disconnected, the message "tel line fail" will be stored in the event log.
The options are: don’t report, immediately, 5 minutes, 30 minutes, 60 minutes or 180 minutes.

GSM/GPRS [Fig 4.5.3(21b)]
Here you determine if the GSM/GPRS line disconnection will be reported or not and determine the delay between detection of line disconnection and report failure. If the telephone line is disconnected, the message "GSM line fail" will be stored in the event log.
The options are: don’t report, 2 minutes, 5 minutes, 15 minutes, or 30 minutes.

Broadband [Fig 4.5.3(21c)]
Here you determine if the Broadband Module line disconnection will be reported or not and determine the delay between detection of line disconnection and report failure. If the telephone line is disconnected, the event "BBA line fail" will be stored in the event log.
The options are: don’t report, 2 minutes, 5 minutes, 15 minutes, or 30 minutes.

PSTN Up / Down [Fig 4.5.3(22)]
Remote Access [Fig 4.5.3(22a)]
Here you give or deny permission to access the system and exercise control from a remote telephone.
The options are: rem. access ON and rem. access OFF.

Mast. Downl Code [Fig 4.5.3(22b)]
Here you determine the master installer 4-digit password for downloading/uploading data into/from the PowerMaxPro memory.

Attention! If ”0000” is used, it will not enable connection of the PowerMaxPro to the PC for upload/download purpose.

Inst. Downl Code [Fig 4.5.3(22c)]
Here you determine the installer 4-digit password for downloading data into the PowerMaxPro memory.

Attention! If ”0000” is used, it will not enable connection of the PowerMaxPro to the PC for upload/download purpose.

Upload Option [Fig 4.5.3(22d)]
Here you determine whether the PowerMaxPro data can be uploaded to a computer while the system is in disarm state or at any time (in HOME/AWAY arming & disarm state).
The options are: when system OFF and any time.

Up Download Tel# [Fig 4.5.3(22e)]
Here you enter the telephone number (up to 16 digits) of the UL/DL server.

Note: Only for use with control panels monitored by compatible central stations. Leave empty if not used.

GPRS Up / Down [Fig 4.5.3(23)]
My SIM Tel. # [Fig 4.5.3(23a)]
Here you enter the PowerMax SIM card telephone number. The central station dials this number when it needs to connect to the PowerMaxPro for uploading / downloading data.

1st Caller ID# [Fig 4.5.3(23b)]
Here you determine the 1st IPMP receiver telephone number. When the PowerMaxPro responds to an incoming call from the telephone number defined here, it creates a connection to the IPMP for uploading / downloading data.

2nd Caller ID# [Fig 4.5.3(23c)]
Here you determine the 2nd IPMP receiver telephone number. When the PowerMaxPro responds to an incoming call from the telephone number defined here, it creates a connection to that IPMP for uploading / downloading data.

2 Way Voice Def. [Fig 4.5.3(24)]
Send 2 WV Code [Fig 4.5.3(24a)] - see note in Fig. 4.5
Here you determine whether the system will send two-way voice code to the central station (to turn the central station from data communication to voice communication state) by using pre-selected SIA or Contact-ID communication format only.
The options are: send and don’t send.

Two Way Voice Central Stations [Fig 4.5.3(24b)] - see note in Fig. 4.5
Here you select the timeout for 2-way voice communication with Central Stations, or enable the central station to ring back for 2-way voice function. This option is applicable only after reporting an event to the central station. (The central station person can press [3] for listen-in", [1] for "speak out" or [6] for listening and speaking). The options are: 10, 45, 60, 90 seconds, 2 minutes, ring back and disable (no two-way voice communication).

Note: If “Ring Back” is selected, you should select “Disable Report” for private telephone (see par. 4.5.4(1) - Reporting to Private Telephones), otherwise the central station will establish communication with the PowerMaxPro (after an event occurrence) in the normal manner (and not after one ring).

Ringback Time [Fig 4.5.3(24c)] - see note in Fig. 4.5
Here you determine the period during which the central station can establish 2-way voice communication with the PowerMaxPro (after 1 ring), if:
A. Alarm type message was received by central station.
B. Ring Back function was selected [see par. 4.5.3(23b)].
The options are: 1, 3, 5 or 10 minutes.

Ambient Level [Fig 4.5.3(24d)]
Here you select the ambient noise level of the installation. If it is a relatively noisy environment, set it to High (default setting). If it is a very quiet environment, set to Low. The options are: low and high.

Report Cnfrm Alarm [Fig 4.5.3(25)] - see note in Fig. 4.5
Here you determine whether the system will report whenever 2 or more events (confirmed alarm) occur during a specific period (see par. 4.4.33). Available options are: enable report, disable report, enable + bypass (enabling report and bypassing the detector - applicable to PowerMaxPro that is compatible with DD243 standard).
Recent Close [Fig 4.5.3(26)]
Here you enable or disable the “recent closing” report, that is sent to the central station if an alarm occurs within 2 minutes from the expiry of the exit delay.

The options are: recent close ON and recent close OFF.

Zone restore [Fig 4.5.3(27)]
Here you determine whether a zone restore will be reported or not.

The options are: report restore and don’t report.

System Inactivity Report [Fig 4.5.3(28)]
Here you determine whether the central station will receive a message if the system is inactive (not armed) during a defined period (days).

The options are: disable, rep. after 7d, rep. after 14d, rep. after 30d, rep. after 90d.

Call Waiting OFF [Fig 4.5.3(29)]
Here you enter a code to cancel "call waiting" when calling the central station.

4.5.4 Private Report  (Fig. 4.5)

Voice report [Fig 4.5.4(2)]

1st Private Tel# [Fig 4.5.4(2a)]
Here you program the 1st telephone number (including area code, if required) of the private subscriber to which the system will report the event groups defined in Report To Private.

2nd Private Tel# [Fig 4.5.4(2b)]
Here you program the 2nd telephone number (including area code, if required) of the private subscriber to which the system will report the event groups defined in Report To Private.

3rd Private Tel# [Fig 4.5.4(2c)]
Here you program the 3rd telephone number (including area code, if required) of the private subscriber to which the system will report the event groups defined in Report To Private.

4th Private Tel# [Fig 4.5.4(2d)]
Here you program the 4th telephone number (including area code, if required) of the private subscriber to which the system will report the event groups defined in Report To Private.

Redial Attempts [Fig 4.5.4(2e)]
Here you determine the number of times the communicator will dial the called party’s number (private telephone).

The options are: 1, 2, 3 and 4 attempts.

Attention! A maximum of 2 dialing attempts is permitted by the Australian Telecommunication Authority.

Two-Way Voice - Private Phones [Fig 4.5.4(2f)]
Here you determine whether 2-way voice communication with private telephones will be allowed or not.

The options are: enable 2-way and disable 2-way.

Tel. acknowledge [Fig 4.5.4(2g)]
Here you determine whether the system will use the single acknowledge or the all acknowledge mode when reporting to private telephones.

Note: In the single acknowledge mode, receiving an acknowledge signal from a single telephone is sufficient to consider the current event closed and call off the communication session. The remaining telephones serve for backup purposes only. In the all acknowledge mode, an acknowledge signal must be received from each telephone before the current event is considered reported.

The options are: single ack and all ack.

SMS Report Tel# [Fig 4.5.4(3)]

1st SMS Tel# [Fig 4.5.4(3a)]
Here you define the first SMS phone number (including area code, 16 digits maximum) to which pre-selected event types will be reported.

2nd SMS Tel# [Fig 4.5.4(3b)]
Here you define the second SMS phone number (including area code, 16 digits maximum) to which pre-selected event types will be reported.

3rd SMS Tel# [Fig 4.5.4(3c)]
Here you define the third SMS phone number (including area code, 16 digits maximum) to which pre-selected event types will be reported.

4th SMS Tel# [Fig 4.5.4(3d)]
Here you define the fourth SMS phone number (including area code, 16 digits maximum) to which pre-selected event types will be reported.
Figure 4.5 – Defining Communications
4.6 GSM Auto Detection
The GSM modem auto detection feature enables automatic enrollment of the GSM modem into the PowerMaxPro control panel memory. GSM modem auto detection is activated in one of two ways: after tamper restore and after reset (power-up or after exiting the installer menu). This causes the PowerMaxPro to automatically scan GSM COM ports for the presence of the GSM modem. In the event that the GSM modem auto detection fails and the modem was previously enrolled in the PowerMaxPro control panel, the message “Cel Rmvd Cnfrm” will be displayed. This message will disappear from the display only after the user clicks [i] OK [i]. The modem is then considered as not enrolled and no GSM trouble message will be displayed.

Note: A message is displayed only when the PowerMaxPro alarm system is disarmed.

4.7 PowerLink Auto Detection
The PowerLink modem auto detection feature enables automatic enrollment of the PowerLink modem into the PowerMaxPro control panel memory. PowerLink modem auto detection is activated in one of two ways: after tamper restore and after reset (power-up or after exiting the installer menu). This causes the PowerMaxPro to automatically scan PowerLink COM ports for the presence of the PowerLink modem. In the event that the PowerLink modem auto detection fails and the modem was previously enrolled in the PowerMaxPro control panel, the message “BBA Remvd Cnfrm” will be displayed. This message will disappear from the display only after the user clicks [i] OK [i]. The modem is then considered as not enrolled and no PowerLink trouble message will be displayed.

Note: A message is displayed only when the PowerMaxPro alarm system is disarmed.

4.8 DEFINING OUTPUT PARAMETERS

4.8.1 Preliminary Guidance
This mode enables you to determine X-10 / PGM outputs.

a. Events/conditions selection under which PGM (programmable) output and fifteen “X-10” devices will function.

b. Function type selection for every X-10 unit and PGM output.

c. General definitions selection for X-10 units.

d. Selection of the internal siren or STROBE light (that will be activated according to system programming).

e. Enrolling 2-way X-10 units.

The process is shown in Fig. 4.8. Each selected option is displayed with a dark box at the right side. To review the options, repeatedly click [i] OK [i] or [i] button, until the desired option is displayed, then click [i] OK [i] button.

Note: The X-10 and the PGM outputs operate on the entire alarm system and not per partition (in a PowerMaxPro Partition system).

4.8.2 Define PGM
For the PGM output, you can select disable, turn on, turn off or pulse active (turn on for predefined period, selected by PULSE TIME), as follows:

- BY ARM AWAY (upon AWAY arming).
- BY ARM HOME (upon HOME arming).
- BY DISARM (upon disarming).
- BY MEMORY (activated upon registration of an alarm in the memory, turned off upon memory clearing).
- BY DELAY (during exit / entry delays).
- BY KEYFOB (upon AUX button pressing in the keyfob transmitter / MCM-140+, if “PGM/X-10” is selected in “Define Panel” menu, locations 17 and 18).
- BY ZONES (by disturbance in each of 3 selected zones, irrespective of arming / disarming). If you select toggle, the PGM output will be turned on upon event occurrence in these zones and will be turned off upon next event occurrence, alternately.
- BY LINE FAIL: PGM output is ON if telephone line is disconnected.
- BY SIREN: this option triggers an external wired siren if no fixed external siren output is installed.

4.8.3 Defining INT/STRB
Here you determine whether the INT output will be used for an internal siren or for a strobe. If strobe is selected, the INT output will be activated when an alarm occurs until the system is disarmed (i.e. clearing alarm memory).

4.8.4 X-10 GENERAL DEF
For X-10 devices, you can select the following actions:

- FLASH ON ALARM - you can select no flash or all light flash, to control X-10 lighting devices in alarm conditions.
- TRBL INDICATION - you can select don’t indicate or indicate for X-10 failure indication by the TROUBLE LED.
- FAIL REPORT - you can select report to central station 1, report to central station 2, report to private telephone and send SMS, for X-10 devices failure reporting.
- 3 PHASES & FREQ (you can select disable 3 phase, 3 phase 50 Hz, or 3 phase 60 Hz to define the X-10 signal transmission type).
- LOCKOUT TIME - you can enter daytime limits between which X-10 lighting devices controlled by sensors will be off, even when the associated sensors are triggered.

4.8.5 X-10 UNIT DEFINE
For the fifteen X-10 units you can perform the following programming actions:

a. House code selection (a code letter from A to P that will distinguish the site in which the system is installed from other sites in the neighborhood).

b. Specific number definition for every X-10 unit (01 – 15).

c. Enrolling 1-way X-10 units

d. Enrolling 2-way X-10 units (that can perform status reporting).

Note: If a 2-way X-10 unit is installed without enrolling, interference to the 1-way X-10 units operation may occur.

e. For each X-10 unit you can select disable, turn on, turn off or pulse active (turn on for predefined period, selected by PULSE TIME), upon the following conditions:

- X-10 LOCATION (the location of the stored X-10 unit).
- BY ARM AWAY (upon AWAY arming).
- BY ARM HOME (upon HOME arming).
- BY DISARM (upon disarming).
- BY MEMORY (activated upon registration of an alarm in the memory, turned off upon memory clearing).
- **BY DELAY** (during exit / entry delays).
- **BY KEYFOB** (upon AUX button pressing in the keyfob transmitter / MCM-140+, if “PGM/X-10” is selected in “Define Panel” menu, location 17).

- **BY ZONES** (by disturbance in each of 3 selected zones, irrespective of arming / disarming). If you select toggle, the X-10 output will be turned on upon event occurrence in these zones and will be turned off upon next event occurrence, alternately.

---

**Figure 4.8 - Define Outputs Flow Chart**

---

26

D-302541 PowerMaxPro Installer’s Guide
4.9 DEFINE VOICE

4.9.1 Record Speech
This mode allows you to record short-duration speech messages for the following purposes:

- **House identity** is a message announced automatically when events are reported to private telephones.
- **4 User Names** can be recorded and assigned to users numbered 5-8. In case of event, the relevant user name will be added to the message that will be reported via the telephone.

- **5 custom zone names** can be recorded and assigned to specific zones. These names are useful if none of the 26 fixed zone names are found suitable for a certain zone (see fig. 4.3).
- **Edit custom zone names** enables you to edit the names that have been assigned to zones.

The recording process is shown below.

4.9.2 Speech Box Mode
This mode allows you to determine whether two-way voice communication is to be sounded either via an external speakerphone, via the PowerMaxPro, or via both.

(see figure 4.1a)

9. DEFINE VOICE

---

**Figure 4.9 - Speech Recording Flow Chart**
4.10 DIAGNOSTIC TEST

This mode allows you to test the function of all protected area wireless sensors / wireless sirens / wireless keypads / GPRS / LAN connection / options for resetting the Broadband Module and to receive / review information regarding the received signal strength.

The diagnostic test process is shown in figure 4.10.

For WL Sensors / WL Sirens / WL Keypads:
Three reception levels are sensed and reported.

Received Signal Strength Indication:

<table>
<thead>
<tr>
<th>Reception</th>
<th>Buzzer Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strong</td>
<td>Happy Tune twice ( - - ---- ) (- - ---- )</td>
</tr>
<tr>
<td>Good</td>
<td>Happy Tune ( - - ---- )</td>
</tr>
<tr>
<td>Poor</td>
<td>Sad tune ( ------ )</td>
</tr>
</tbody>
</table>

IMPORTANT! Reliable reception must be assured. Therefore, a "poor" signal strength is not acceptable. If you get a "poor" signal from a certain wireless unit, re-locate it and re-test until a "good" or "strong" signal strength is received. This principle should be followed during the initial testing and also throughout subsequent system maintenance.

4.10.1 GPRS Communication Test

The GPRS Communication diagnostic procedure tests GSM/GPRS communication and reports the diagnostic result. In case of communication failure, detailed information of the failure is reported.

The following GSM/ GPRS messages are reported:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit is OK</td>
<td>GSM / GPRS is functioning correctly.</td>
</tr>
<tr>
<td>GSM comm. loss</td>
<td>The GSM/GPRS module does not communicate with the Panel</td>
</tr>
<tr>
<td>Pin code fail</td>
<td>Missing or wrong PIN code. (Only if SIM card PIN code is enabled.)</td>
</tr>
<tr>
<td>GSM net. fail</td>
<td>Unit failed with registration to local GSM network.</td>
</tr>
<tr>
<td>SIM card fail</td>
<td>SIM not installed or SIM card failure.</td>
</tr>
<tr>
<td>No GPRS service</td>
<td>GSM auto enroll failed to detect GSM/GPRS module.</td>
</tr>
<tr>
<td>GPRS conn. fail</td>
<td>The SIM card does not have the GPRS service enabled.</td>
</tr>
<tr>
<td>SRVr unavailable</td>
<td>GPRS has not connected to the Panel</td>
</tr>
<tr>
<td>APN not defined</td>
<td>APN is not configured.</td>
</tr>
<tr>
<td>SIM card locked</td>
<td>After entering a wrong PIN code 3 consecutive times the SIM is locked. To unlock it enter a PUK number. The PUK number cannot be entered by the PowerMaxPro.</td>
</tr>
<tr>
<td>Denied by server</td>
<td>The IPMP denies the connection request. Check that the Panel is registered to the IPMP Receiver.</td>
</tr>
</tbody>
</table>

4.10.2 LAN Connection Test

The LAN Connection diagnostic procedure tests Broadband Module communication to the IPMP and reports the diagnostic result. In case of communication failure, detailed information of the failure is reported.

If the Broadband Module is not registered to the PowerMaxPro, the menu "LAN CONNECT.TEST" will not be displayed.

The following LAN messages are reported:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit is ok</td>
<td>Broadband Module is functioning correctly.</td>
</tr>
<tr>
<td>Test aborted</td>
<td>The diagnostic test is aborted, as follows:</td>
</tr>
<tr>
<td>Comm. loss</td>
<td>The RS-232 serial interface between the Broadband Module and the PowerMaxPro failed.</td>
</tr>
<tr>
<td>Rcvr Ip missing</td>
<td>Receivers IP 1 and 2 settings are missing in the PowerMaxPro.</td>
</tr>
<tr>
<td>Cable unplugged</td>
<td>The Ethernet cable is not connected to the Broadband Module.</td>
</tr>
<tr>
<td>Check lan config</td>
<td>This message appears in any of the following cases:</td>
</tr>
<tr>
<td>Rcvr1 UnReach. Rcvr2 UnReach.</td>
<td>Receiver 1 or 2 is inaccessible, as follows:</td>
</tr>
<tr>
<td>Broadband Module timeout err.</td>
<td>Broadband Module does not respond to test result within 70 sec.</td>
</tr>
</tbody>
</table>

4.10.3 LAN Reset

LAN Reset performs reset of the Broadband Module.
If the Broadband Module is not registered to the PowerMaxPro, the menu "LAN RESET OPTION" will not be displayed.
4.11 USER FUNCTIONS

This mode provides you with a gateway to the user functions through the regular user programming menu. Refer to the User Guide for detailed procedures.

**Note:** User functions are not available from the Installer Mode in UK control panels.

Caution! If after having programmed the user codes the system does not recognize your installer code, this indicates you must have programmed a user code that is identical with your installer code. If so, access the user menu and change the code that is identical with your installer code. This will re-validate your installer code.

4.12 RETRIEVING FACTORY DEFAULTS

If you want to reset the PowerMaxPro parameters to the factory default parameters, you should enter the installer menu and perform the "FACTORY DEFLT" function, as described in the right side illustration. To obtain the relevant parameters defaults, contact the PowerMaxPro dealer.

**Note:** For PowerMaxPro with 2 installer codes, INSTALLER code and MASTER INSTALLER code, only the master installer code enables to perform factory default function.

4.13 SERIAL NUMBER

The menu "13. SERIAL NUMBER" enables reading the system serial number for support purposes only. Clicking enables reading the version of the PowerMaxPro unit.

4.14 CALLING UPLOAD/DOWNLOAD SERVER

This option allows the installer to initiate a call to the upload/download server. The server uploads the PowerMaxPro configuration to its data base and can upload predefined parameters to the PowerMaxPro

**Note:** This option is only used during the installation of panels monitored by compatible central stations.
4.15 ENABLING/DISABLING PARTITIONS

This mode allows you to enable/disable the partitioning feature. Partitioning allows you to divide the system into a maximum of three independently controllable areas. A different user code is assigned to each partition or one user code is assigned to all partitions in order to limit or control access to each area. A partition can also be armed or disarmed regardless of the status of the other partitions within the system.

When the partition feature is disabled, zones, user codes and features will operate the same as in a regular PowerMaxPro unit. When partition is enabled, menu displays are changed to incorporate the partition feature.

4.16 DEFINING THE ARMING STATION

This mode allows you to customize the MKP-160 2way keyprox device through the control panel and adapt the device characteristics and behavior to the requirements of the particular user.

4.16.1 Tamper Type

Enabling the function will enable a tamper open / close message.

Available options are: disable and enable.

4.16.2 Screen Saver

Enabling the function will turn off the display if no key is pressed for more than several seconds. Available options are: disable (ac) and enable.

4.16.3 Show AC Failure

Enable/disable AC failure indication on the keyprox device. Available options are: disable and enable.
4.16.4 Supervision
Define whether or not the control panel will monitor supervision messages sent by the keyprox.
Available options are: **enable** and **disable**.

4.16.5 Exit-Entry Beeps
Define whether or not the keyprox will sound the exit and entry beeps or whether the keyprox will sound the beeps only when the system is armed AWAY and not when it is armed HOME.
Available options are: **off**, **off when home** and **on**.

Note: Only AC versions of the MKP-160 keyprox provide Piezo beeps.

4.16.6 Sounder Volume
Define the volume level of the sounder.
Available options are: **low**, **mid** and **high**.

4.16.7 Show Mem/Trbl
Define if Trouble or Memory events in the control panel will be indicated on the LCD keyprox.
Available options are: **enable** and **disable**.

Figure 4.16 – MKP-160 Configurations Flow Chart

4.17 WALK-TEST
This mode (see Figure 4.1a) provides you with the means to conduct a periodic test, via the walk-test menu, at least once a week and after an alarm event.

When you are instructed to perform "walk test", walk throughout the site to check the detectors / sensors. When a detector/sensor is triggered into alarm, its name, number and the alarm reception level should be indicated (for example, “Bathroom”, “Z19 strong”) and the buzzer should sound according to the alarm reception level (1 of 3).

5. TESTING PROCEDURES

Note: The system is intended to be checked by a qualified technician at least every 3 years.

5.1 Preparations
Make sure all windows and doors are closed and all zones are secured (undisturbed).

If the display is “NOT READY”, query the control panel by pressing the **OK** button repeatedly. The source(s) of the problem(s) will be displayed and read aloud. Take the necessary measures to eliminate the problem(s) before testing the system (see next paragraph).

5.2 Diagnostic Test
To verify proper function of all detectors in the system, a comprehensive diagnostic test is required. To perform this test, refer to Figure 4.10.

5.3 Keyfob Transmitter Test
Initiate transmission from each transmitter enrolled as a keyfob unit (according to the list in Table A2, Appendix A). Use each transmitter to arm the control panel AWAY and immediately disarm it. Upon pressing the keyfob unit’s AWAY key, the ARM indicator should light.

The exit delay beeps will begin. Press the keyfob unit’s DISARM (\(\text{\(\uparrow\)}\)) key. The ARM indicator should extinguish, the announcement “Disarm, ready to arm” should be heard and the display should revert to:

```
<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>READY</td>
</tr>
<tr>
<td>HH : MM</td>
</tr>
</tbody>
</table>
```

Test the AUX button in each keyfob in accordance with the information noted in Table A.2, Appendix A. Verify that the AUX button performs its duty as programmed.

* If the AUX (\(\text{\(\uparrow\)}\)) button is defined as “STATUS”, system status should be displayed and announced upon pressing the button.
* If the AUX (\(\text{\(\uparrow\)}\)) button is defined as “INSTANT”, press the AWAY button and then the AUX button. The response should be:

```
<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ARMING INSTANT</td>
</tr>
<tr>
<td>(alternating)</td>
</tr>
<tr>
<td>PLEASE EXIT NOW</td>
</tr>
</tbody>
</table>
```

and the exit delay beeps will start. Press the DISARM (\(\text{\(\uparrow\)}\)) key immediately to disarm.
If the AUX () button is programmed as “PGM / X-10” and permitted to activate one or several X-10 units, pressing () should activate the appliance controlled by the chosen X-10 unit(s).

If the AUX () button is programmed as “PGM / X-10” and permitted to activate the PGM output, pressing () should activate the device wired to the PGM output.

5.4 Appliance ON/OFF Test
The “X-10 unit assignment” information that you noted in Appendix B of this manual is very useful for this test.

Go over the table in Appendix B column by column. If, for instance, the “BY ARM AWAY” column has “X”s marked in the rows pertaining to units 1, 5 and 15 - then arm AWAY the system and verify that the appliances controlled by these units are actually activated upon arming.

Continue in the same manner in the following columns, always creating the state or event that will activate the relevant units. Verify that all appliances are activated as programmed.

IMPORTANT! Before testing “BY TIMER” and “BY ZONE”, make sure that these forms of control are permitted - click repeatedly and verify that the display shows:

and:

6. MAINTENANCE

6.1 Dismounting the Control Panel
A. Release the 2 screws that fasten the front unit to the back unit (see Figure 3.1k).
B. Remove the 3 screws that fasten the back unit to the mounting surface (see Figure 3.1a) and remove the control panel.

6.2 Replacing the Backup Battery
Replacement and first-time insertion of battery pack is similar (see Figure 3.1h).
Insert a fresh battery pack, and then tighten the battery compartment lid; the TROUBLE indicator should extinguish. However, the “MEMORY” message will now blink in the display (caused by the “tamper” alarm you triggered when opening the battery compartment lid). Clear it by arming the system and immediately disarming.

6.3 Fuse
The PowerMaxPro has two internal fuses that have automatic reset. Therefore, there is no need to replace fuses.

When over current condition occurs, the fuse cuts off the circuit current. Upon fault current being removed for several seconds, the fuse is automatically reset and allows current flow through the circuit again.

6.4 Replacing/Relocating Detectors
Whenever maintenance work involves replacement or re-location of detectors, always perform a full diagnostic test according to par. 4.10.

Remember! A “poor” signal is not acceptable, as stated at the end of the test procedure.

7. READING THE EVENT LOG

Up to 100 events can be stored in the event log. You can access this log and review the events, one by one. The log uses the first in, first out (FIFO) principle. If the event log fills up completely (100 events), the oldest event is deleted upon registration of each new event.

The date and time of occurrence are memorized for each event.

When reading the event log, events are shown in chronological order - from the newest to the oldest. Access to the event log is provided by clicking the asterisk key and not through the installer’s menu. Reading and erasing process of the event log is shown in the next drawing.

Note: Up to 250 events can be stored in the event log via the Upload / Download software application.

Event is displayed in 2 parts, for example, “Z13 alarm” then “09/02/00 3:37 P”. The two displays will be shown alternately until clicking again to move to the next event or until the end of the event log (4 minutes).

Applicable only if installer code is entered. Not applicable in European countries.

A dark box at the extreme right means that these functions are enabled.

The easiest way for test timed activation is to select the ninth item in the installer’s menu (“10. USER SETTINGS”) and set the system clock a few minutes before the relevant “start time”. Do not forget to return the clock to the correct time after completion of this test.

5.5 Emergency Transmitter Test
Initiate transmission from each transmitter enrolled to an emergency zone (according to the list in Table A3, Appendix A). For example, upon pressing the transmit button of an emergency transmitter enrolled to zone 22, the display should read:

It is advisable to let the central station know that you are conducting this test, or just disconnect the telephone line from the PowerMaxPro during the test, to prevent false alarms.
APPENDIX A. Partitioning

Your system is equipped with an integrated partitioning feature that can divide your alarm system into three distinct areas identified as Partition 1 through 3. Partitioning can be used in installations where shared security systems are more practical, such as a home office or warehouse building. When partitioned, each zone, each user code and many of your system's features can be assigned to Partition 1 to 3.

Note: When Partition Mode is disabled, all zones, user codes, and features of the PowerMaxPro will operate as in a regular unit. When partition mode is enabled, all zones, user codes, and features of the PowerMaxPro are automatically assigned to Partition 1.

A1. Programming Partitions

Your system arrives with partitioning disabled.

To Enable Partitioning

A. Enter PowerMaxPro installer Mode (see par. 4.1.5). The PowerMaxPro display will read “1. NEW INSTL CODE”.

B. Click the button repeatedly until the PowerMaxPro display will read:

15. PARTITIONING

C. Click . The PowerMaxPro display will read:

Disable

D. Click the button. The PowerMaxPro display will read:

Enable

E. Click the button. The PowerMaxPro display will change to:

Enable

F. Click the button again to confirm the new setting.

A2. Defining Zones

Partitioning is defined by zones that are assigned to each partition. During programming each zone should be assigned to one or more partitions.

To Define Zones

A. Enter PowerMaxPro installer Mode (see par. 4.1.5). The PowerMaxPro display will read “1. NEW INSTL CODE”.

B. Click the button twice. The PowerMaxPro display will read:

3 DEFINE ZONES

C. Click the button. The PowerMaxPro display will read:

ZONE No: --

D. Enter a zone number, for example, 05. The PowerMaxPro display will read:

05: TYPE --

E. Proceed by setting the zone type, name and chime option (see par. 4.3).

F. After setting the chime option select PARTITION. If zone number was set to 05 the PowerMaxPro display will read:

05: P1 P2 P3

G. Press , , and to select the desired corresponding partitions. If a zone is assigned to two or more partitions, this indicates that the zone is located in a common area and will behave according to the state of both partitions. (For a detailed description on common areas, refer to the “Common Areas” section below.)

H. Press twice to confirm the settings.

A3. Enrolling Keyfobs and Keypads

This section provides instructions for enrolling keyfobs and keypads into the PowerMaxPro system.

To Enroll a Keyfob

Keyfob transmitter enrolling involves the following steps:

A. Having entered your Installer Code successfully (see section 4.1.5), Click the button (repeatedly, if necessary) until the display will read:

2. ENROLLING

B. Click . The display will read:

ENROLLING TYPE

C. Click the button repeatedly until the display will read:

ENROLL KEYFOB

D. Click . The display will read:

KEYFOB No: 

E. Suppose that the Keyfob you are about to enroll is to be designated as Keyfob No. 5. Assuming that memory location No. 5 is free - no keyfob has yet been enrolled to it - click the <5> key. The display will change to:

KEYFOB No: 5

The clear space at the far right tells you that the memory location is free.

F. Click . The display will prompt you to initiate a transmission from the chosen keyfob:

TRANSMIT NOW

G. Initiate a transmission from the chosen keyfob by pressing any one of its pushbuttons. In response, the “Happy Tune” (- - ----) will sound. When partition is disabled, the display will read:

KEYFOB No: 5

Proceed to step “K” below.

When partition is enabled, the display will read:

ACCESS TO PART

H. Click . The display will read:

F01: P1 P2 P3

I. Select the desired partitions that will be associated and can be controlled by this keyfob via pushbuttons 1, 2 and 3 on the control panel keypad.

J. Click . The display will read:

KEYFOB No: 5

A dark box will appear at the far right, indicating that the chosen Keyfob has been enrolled as Keyfob No. 5.

K. From this point on, you may continue in several different directions:

• If you wish to enroll another keyfob, select the desired number by:
To Enroll a Keypad
Keypad enrolling involves the following steps:

A. Having entered your Installer Code successfully (see section 4.1.5), Click the button (repeatedly, if necessary) until the display will read:
   
   2. ENROLLING

B. Click . The display will read:
   
   ENROLLING TYPE

C. Click the button repeatedly until the display will read:
   
   ENROLL WL 1WAY KP

D. Click . The display will read:
   
   1way kp No:

E. Suppose that the Keypad you are about to enroll is to be designated as Keypad No. 5. Assuming that memory location No. 5 is free - no keypad has yet been enrolled to it - click the 5 key. The display will change to:
   
   1way kp No:  5

   The clear space at the far right tells you that the memory location is free.

F. Click . The display will prompt you to initiate a transmission from the chosen keypad:
   
   TRANSMIT NOW

G. Initiate a transmission from the chosen keypad by pressing any one of its pushbuttons. In response, the “Happy Tune” (- - - - - - -) will sound. When partition is disabled, the display will read:
   
   1way kp No:  5

   Proceed to step “K” below.

   When partition is enabled, the display will read:

H. Click . The display will read:
   
   C01: P1, P2, P3

I. Select the desired partitions that will be associated and can be controlled by this keypad via pushbuttons 1, 2 and 3 on the control panel keypad.

J. Click . The display will read:
   
   1way kp No:  5

   A dark box will appear at the far right, indicating that the chosen keypad has been enrolled as Keypad No. 5.

K. From this point on, you may continue in several different directions:
   - If you wish to enroll another keypad, select the desired number by:
     - Clicking to go up (6→7→8.....)
     - Clicking to go down (4→3→2.....)
     - Clicking  → <keypad #>.
   - To return to the main menu, click . This will bring back the display:
     
     <OK> TO EXIT

You may now review and select any other mode on the User menu (by clicking or ).

A4. User Interface and Operation
Refer to the PowerMaxPro User Guide Appendix A PARTITIONING for a detailed description of the user interface (Arming/Disarming, siren behavior, show function, keyfobs operation, etc.), in Partition Mode.

A5. Common Areas
Common areas are areas used as walkthrough zones to areas of 2 or more partitions. There may be more than one common area in an installation depending on the layout of the property. A common area is not the same as a partition; it cannot be armed / disarmed directly. Common areas are created when you assign a zone or zones to 2 or 3 partitions. Table A1 summarizes the behavior of the different zone types in a common area.
### Table A1 – Common Area Definitions

<table>
<thead>
<tr>
<th>Common area zone types</th>
<th>Definition</th>
</tr>
</thead>
</table>
| **Perimeter**          | Acts as defined only after the last assigned partition is armed AWAY or HOME.  
                           | In case that one of the partitions is disarmed, an alarm initiated from this zone is ignored for all assigned partitions. |
| **Delay zones**        | Delay zones will not trigger an entry delay unless all assigned partitions are armed. It is, therefore, not recommended to define delay zones as common areas. |
| **Perimeter follower** | Act as defined only after the last assigned partition is armed AWAY or HOME.  
                           | In case that one of the partitions is disarmed, an alarm initiated from this zone is ignored for all assigned partitions.  
                           | In case that one of the common area assigned partitions is in a delay state (and the other partitions are armed), the alarm will behave as a perimeter follower for this partition only. The event will be ignored for other assigned armed partitions. |
| **Interior**           | Acts as defined only after the last assigned partition is armed AWAY.  
                           | In case that one of the partitions is disarmed or armed HOME, an alarm initiated from this zone is ignored for all assigned partitions. |
| **Interior follower**  | Acts as defined only after the last assigned partition is armed AWAY.  
                           | In case that one of the partitions is disarmed or armed HOME, an alarm initiated from this zone is ignored for all assigned partitions.  
                           | In case that one of the common area assigned partitions is in a delay state (and the other partitions are armed), the alarm will behave as an interior follower for this partition only. The event will be ignored for other assigned armed partitions. |
| **Home / Delay**       | Acts as a Perimeter-Follower type when all assigned partitions are armed AWAY.  
                           | Acts as a Delay type when at least one of the assigned partitions is armed HOME.  
                           | Will be ignored when at least one of the assigned partitions is disarmed. |
| **Guard**              | A Guard-box is a metal safe (usually) containing the physical keys needed to enter the building. Following an alarm, the safe becomes available to a trusted Guard who can open the Guard-box, obtain the keys and enter the secured premises. The Guard-box zone functions like a 24-hour audible zone, except that following a short time period after an alarm, the alarm is disabled (to allow access to the safe by a Guard).  
                           | **Note:** Opening or closing the Guard-box causes the PowerMaxPro to send notification to the monitoring station. |
| **Outdoor (Monitored Zone)** | In UK, this zone is named Monitored Zone.  
                                 | Upon detection of possible zone violation, the alarms are intended for the home owner's action instead of the Central Monitoring Station, since this zone is outside the home, and does not signal an intrusion into the house. The alarms are sent only to private phones (voice or SMS).  
                                 | **Note:** The Outdoor Zone alarm is not considered a confirmed alarm by UK DDE243 Standard. |
| **Emergency**          | Always armed. |
| **Fire**               |  |
| **Flood**              |  |
| **Gas**                |  |
| **Temperature**        |  |
| **24-hour silent**     |  |
| **24-hour audible**    |  |
| **Non-alarm**          |  |

</table>

**Zone Types:**
- 1 = Interior follower
- 2 = Perimeter
- 3 = Perimeter follower
- 4 = Delay 1
- 5 = Delay 2
- 6 = 24 h silent
- 7 = 24 h audible
- 8 = Fire
- 9 = Non-alarm
- 10 = Emergency
- 11 = Gas
- 12 = Flood
- 13 = Interior
- 14 = Temperature
- 15 = Home/Delay
- 16 = Guard
- 18 = Outdoor

**Zone Locations:** Note down the intended location for each detector. When programming, you may select one of 26 available zone names (plus 5 custom zone names that you can add - see Figure 4.3 - Define Zones).

* Zones 29 & 30 only are hardwired zones.

The SCANCOM data format consists of 13 decimal digits divided into 4 groups, from left to right, as shown at the right side. Each channel is associated with a specific event as follows:

- 1st “C”: Fire
- 2nd “C”: Personal attack
- 3rd “C”: Intruder
- 4th “C”: Open/close
- 5th “C”: Alarm cancel
- 6th “C”: Emergency
- 7th “C”: Second alarm
- 8th “C”: Trouble messages

### D4. Understanding the Scancom Reporting Protocol Data Format

The digit in this position conveys the status of channel 1
The digit in this position conveys the status of channel 8

### APPENDIX E. Programmable Zone Types

#### E1. Delay Zones

A delay zone triggers the entry delay set by you in the course of programming the system. Warning beeps will sound throughout these delays, unless you choose to mute them.

- **Exit Delay** - The exit delay begins once the user arms the system. It allows him to leave via interior zones and disarm the system before the delay expires. When the exit delay starts, the buzzer beeps slowly until the last 10 seconds, during which it beeps rapidly.

- **Entry Delay** - The entry delay begins once the user enters the protected area via a specific doorway (his entry is sensed by a delay zone detector). To avoid an alarm, he must reach the keypad via follower zones and disarm the system before the delay expires. When the entry delay starts, the buzzer beeps slowly until the last 10 seconds, during which it beeps rapidly. The PowerMaxPro has two types of delay zones, for which different delay times may be set.

#### E2. Emergency Zones

You can provide incapacitated, sick or elderly people with a miniature single-button transmitter to be carried on the neck like a pendant or to be worn on the wrist like a watch. In distress situations, they can press the button on their transmitter, causing the PowerMaxPro to send an emergency call to the central monitoring station or to private telephones designated by the installer.

#### E3. Fire Zones

A fire zone uses smoke detectors and is permanently active (a fire alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of smoke, a pulsating siren sounds immediately and the event is reported via the telephone line.

#### E4. Flood Zone

A flood zone is permanently active (a flood alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of flood leak, the event is reported via the telephone line.

#### E5. Gas Zone

A gas zone is permanently active (a gas alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of gas leak, the event is reported via the telephone line.
E6. Interior Zone
Interior zones are zones within the protected premises that have nothing to do with perimeter protection. Their most important feature is that they allow free movement within the protected area without initiating an alarm, provided that the system is armed in the "HOME" mode. People can therefore stay at home and move about freely, as long as they do not disturb a PERIMETER zone.

Once the system is armed in the AWAY mode (all zones are protected), interior zones will initiate an alarm if violated.

E7. Interior Follower Zones
"Interior Follower" zone is a zone that is located between entry/exit zone and the alarm system control panel. This zone is temporarily ignored by the alarm system during entry/exit delay periods, to enable you to walk (without causing an alarm) in front of a motion detector that is associated with the Interior Follower zone, after you enter through an entry zone on the way to the control panel, or when leaving the protected premises after system arming.

E8. Home/Delay Zones
A zone type which functions as a delay zone when the system is armed HOME and as a perimeter-follower zone when the system is armed AWAY.

E9. Non-Alarm Zones
A non-alarm zone does not directly participate in the alarm system. Its main use is to perform auxiliary remote control tasks such as opening/closing a gate, activating/deactivating courtesy light and similar applications. No alarm, silent or otherwise, is associated with a non-alarm zone.

For remote control of electrical sensors, you can define the desired number of non-alarm zones and enroll a portable transmitter or a wireless sensor (detector) to this type of zone. Then, you must ensure that these zones are permitted to control the PGM output, or the X-10 units or both (see par. 4.8). Next, you can select the zones (3 at most) that will control each output. The outputs, in turn, will control the external electrical sensors.

Note: A sensor control can also be carried out by holders of all keyfob transmitters, by pressing the AUX [g] button. This method will work provided that you programmed the [g] button for PGM/X-10 control (see Par. 4.4.17 and 4.4.18), and that you programmed the PGM output and the X-10 units to be controlled by keyfob transmitters (see par. 4.8).

E10. Perimeter Zones
Perimeter zones rely on detectors designed to protect doors, windows and walls. An immediate alarm is initiated when such a zone is violated by opening the door/window or by trying to break the wall.

E11. Perimeter Follower Zones
A non-entry/exit zone, typically a perimeter zone located on an entry/exit path treated as an entry/exit zone during an entry/exit time.

E12. Temperature Zone
A temperature zone uses a wireless temperature detector to detect both indoor and outdoor temperatures and is permanently active. The detector monitors room temperature using an internal sensor. For outdoor or refrigerator installations, a waterproof temperature probe (optional) is used. There are a total of four fixed temperature points and the user can enable one or more temperature point.

Upon detection of change in temperature a digital message is transmitted and the event is reported.

E13. 24-Hour Zones
24 hour zones are mainly used for PANIC buttons, perimeter detectors and anti-tamper protection. They therefore trigger an alarm in both armed and disarmed states.

- **24 Hour Zone - Silent.** - Upon detection, this zone initiates a silent alarm, meaning that the sirens do not function. Instead the PowerMaxPro dials telephone numbers and reports the event to central stations and/or to private telephones, as programmed.
- **24 Hour Zone - Audible.** - Upon detection, this zone initiates a siren alarm. The PowerMaxPro also dials telephone numbers and reports the event to central stations and/or to private telephones, as programmed.

E14. Key Zones (Optional)
Key zones are zones that can be used for arming and disarming the system by MCT-100 and MCT-102 PowerCode transmitters that are enrolled to a zone. In addition, the alarm system may be armed / disarmed by a keyswitch when connected to wired zones 29 and 30.

Defining a zone as a KEY ZONE includes the following actions:

a. The zone should be defined as non-alarm type zone (see par. 4.3).

b. "Z-KEY ENABLE" should be selected for such a zone (see par. 4.3).

c. According to the zone number, "z. 21-28 enable", "z. 29-30 enable", or "z. 21-30 enable" should be selected in the DEFINE PANEL menu (see par. 4.4.39).

E15. Guard Zones
A Guard-box is a metal safe (usually) containing the physical keys needed to enter the building. Following an alarm, the safe becomes available to a trusted Guard who can open the Guard-box, obtain the keys and enter the secured premises. The Guard zone functions like a 24-hour audible zone, except that following a short time period after an alarm, the alarm is disabled (to allow access to the safe by a Guard).

Note: Opening or closing the Guard-box causes the PowerMaxPro to send notification to the monitoring station.

E16. Outdoor Zones
An Outdoor Zone is used mainly for outdoor areas where an activated alarm does not indicate intrusion into the house. When the detector that is assigned to the Outdoor Zone detects a disturbance, it triggers an alarm and reports it to private phones, but does not report the alarm to the Central Station.

Note: Outdoor / Monitored zones are not part of the confirmed alarm sequence on UK panels.

Note: If a Tower-20 MCW is installed and the Masking Event Reported as Tamper option is enabled (DIP switch 4 = ON), the PowerMaxPro identifies the masking event as a tamper in all instances.

APPENDIX F. PowerMaxPro Compatible Devices

F1 Compatible Detectors
Each detector compatible with the PowerMaxPro system is packed with its own installation instructions. Read them carefully and install as indicated.

A. PIR Motion Detectors
The wireless passive infrared (PIR) motion detectors used in the system are of the PowerCode type. The PowerMaxPro is capable of “learning” each detector’s
identification code and linking it to a specific zone (see par. 4.3 in this Guide). Some units are shown below:

- NEXT® K9-85 MCW
- MCPIR-3000 or K-940 MCW
- DISCOVERY K9-80/MCW

Note: K-940 MCW, Discovery K9-80/MCW and NEXT K9-85 MCW are pet immune units.

In addition to its unique 24-bit identification code, each detector transmits a message, containing status information:
- The detector is in alarm (or not).
- The detector is being tampered with (or not).
- The battery voltage is low (or normal).
- “This is a supervisory message”.

If any of these detectors detects motion, it sends out a message to the alarm control panel. If the system is in the armed state, an alarm will be triggered.

**Wireless PowerCode Infrared Detector CLIP MCW.** A curtain-pattern PIR detector for indoor use and designed for easy installation. An advanced motion analysis method allows the CLIP MCW to distinguish between the true motion of the human body and any other disturbances that cause false alarms. After detection, the detector disarms itself to save battery power. It rearms (reverts to the ready state) if there is no subsequent detection throughout the following 2-minute period.

**Dual technology anti-masking NEXT PLUS Detectors.** The NEXT PIR is a microprocessor-controlled PIR detector, designed for easy installation, free of vertical adjustment. It features a cylindrical lens with uniform detection sensitivity of up to a distance of 15 meters (49 ft) from the detector.

**Wireless PowerCode PIR Detector TOWER 40.** A microprocessor-controlled wireless digital PIR detector, designed for easy installation, free of vertical adjustment. It features parabolic and cylindrical mirrors with uniform detection sensitivity throughout its operating range, up to 18 meters (59 ft), with creep zone protection. An advanced True Motion Recognition™ algorithm (patented) allows the TOWER 40 to distinguish between the true motion of an intruder and any other disturbances which may cause false alarms.

**B. Magnetic Contact Transmitter**

MCT-302 is a PowerCode magnetic-contact transmitter used to detect the opening of a door or a window. The alarm contacts are closed as long as the door or window remains closed.

The unit has an extra alarm input that acts as if it were a separate wireless transmitter. It sends (or does not send) a “restored to normal” message to the alarm system, depending on the setting of an on-board “DIP” switch. The “restore” message informs you, through the control panel's display, whether the door or window is open or closed.

C **MCT-100 Wireless Adapter for Wired Detectors.** MCT-100 is a PowerCode device used mainly as a wireless adapter for 2 regular magnetic switches installed on 2 windows in the same room. It has two inputs, behaving as separate wireless transmitters with different PowerCode IDs. Each input sends (or does not send) a “restored” message to the alarm system, depending on the setting of an on-board “DIP” switch.

D. **Wireless Smoke Detector MCT-425.** A photoelectric smoke detector equipped with a PowerCode-type transmitter. If enrolled to a fire zone, it initiates a fire alarm upon detection of smoke.

E. **Wireless PowerCode Gas Detector MCT-441.** A natural gas detector designed to send an alarm when Methane gas is detected. The detector can be used in a house, apartment, caravan, mobile home or yacht. The detector can send the following messages to the alarm control panel: Gas alarm, gas sensor failure, AC power failure and low battery voltage.

F. **Indoor Wireless CO Gas Detector MCT-442.** The carbon monoxide (CO) detector is designed to monitor the CO gas level in residential dwellings and give early warning before potentially dangerous levels exist. The CO alarm is transmitted to the alarm control panel and presented on its display.

G. **Glass Break Detector MCT-501**

An acoustic detector equipped with a PowerCode-type transmitter. Since it restores automatically after detection, this unit does not send a restoral message to the control panel.

H. **Wireless PowerCode Flood Detector MCT-550.** The flood detector is used to detect the presence of water based fluids at any desired location. Upon flood detection, a digital message is transmitted, composed of the detectors’ PowerCode ID followed by various status and other messages. Alarm and other data are thus forwarded to the alarm control panel.

I. **Wireless temperature detector MCT-560.** Fully supervised wireless PowerCode temperature detector. Can be enrolled to monitor change in temperature. The detector alerts the control panel upon detecting critical indoor or outdoor temperatures. The detector generates an alarm message when its sensor detects that the temperature has reached a certain temperature point. A restore message is generated when it crosses back the threshold temperature point.
J. Contact transmitter MCT-320.

MCT-320 is a fully supervised, PowerCode magnetic contact transmitter, for use with PowerCode products. The transmitter includes a built-in reed switch (that opens upon removal of a magnet placed near it). The MCT-320 tamper switch is activated when the cover is removed or when the detector is removed from the wall. A periodic supervision message is transmitted automatically. The target receiver is thus informed, at regular intervals, of the unit’s active participation in the system.

F2 Compatible Transmitters

The PowerMaxPro system is compatible with multi-button and single button key-ring and hand-held transmitters that use PowerCode and CodeSecure coding methods. Multi-button PowerCode transmitters transmit the same code each time the same button is pressed. They can be used for emergency signaling, for activating the PGM output or for controlling appliances via X-10 units. They can not be used for arming / disarming.

CodeSecure transmitters are of the rolling code type - they transmit a new code each time the same button is pressed. This provides a higher security level, especially in arming / disarming applications, because the code can not be copied (“grabbed”) by unauthorized people.

Following are the basic details of several compatible transmitters. The possible applications for each push-button are indicated in each drawing.

A. MCT-234

One-way 4-button PowerCode 'keyfob' transmitter. You can program the AUX (auxiliary) button to perform various tasks, in accordance with the user’s needs.

Pressing AWAY and HOME together for 2 sec. initiates PANIC alarm.

Pressing AWAY twice for 2 sec. initiates Latchkey arming.

B. MCT-237

Two-way CodeSecure 6-button 'keyfob' transmitter. You can program the AUX (auxiliary) buttons to perform various tasks, in accordance with the user’s needs.

Pressing AWAY and HOME together for 2 sec. initiates PANIC alarm.

Pressing AWAY twice within 2 sec. initiates Latchkey arming.

C. MCT-231 / 201*

(N.A. in North America)

Single-button pendant units. The MCT-231 (CodeSecure) and the MCT-201 (PowerCode) can be enrolled to perform functions as shown. Both units look alike.

D. MCT-134 / 104*

(N.A. in North America) 4-button hand-held units. MCT-134 (CodeSecure) can replace the MCT-234 keyfob. MCT-104 (PowerCode) can perform emergency and non-alarm functions. Both units look alike.

E. MCT-132 / 102*

(N.A. in North America) 2-button units. MCT-132 (CodeSecure) can perform functions as shown. MCT-102 (PowerCode) can perform emergency and non-alarm tasks. Both units look alike.

F. MCT-131 / 101*

(N.A. in North America)

Single-button units. The MCT-131 (CodeSecure) and the MCT-101 (PowerCode) can be enrolled to perform functions as shown. Both units look alike.

G. MCT-211*

Water-proof, wrist-worn Power-Code transmitter. Can be enrolled to perform emergency or non-alarm functions.

H. MCM 140+

The MCM-140+ is a wireless remote control unit that enables the user to arm/disarm the alarm system, to initiate emergency/fire/panic alarms, to turn lighting devices on and off, and for PGM control. The keypad includes an RF transmitter that sends out a differently coded RF signal for each command.

I. MKP-150/151

MKP-150/151/152

The MKP-150/151/152 operates using two-way encrypted coded transmission and provides aural and visual indications. For each control panel, a maximum of two MKP-150/151/152 keypad devices may be enrolled. The device enables the user to arm/disarm the alarm system, to initiate emergency/fire/panic alarms and to turn lighting devices on and off.
J. MKP-160
A 2-way wireless PowerCode touch screen keyprox. Enables most common everyday user functions and is compatible for use with partitions.

K. Contact transmitter MCT-320.
MCT-320 is a fully supervised, PowerCode magnetic contact transmitter, for use with PowerCode products. The transmitter includes a built-in reed switch (that opens upon removal of a magnet placed near it). The MCT-320 tamper switch is activated when the cover is removed or when the detector is removed from the wall. A periodic supervision message is transmitted automatically. The target receiver is thus informed, at regular intervals, of the unit's active participation in the system.

F4. Compatible Speech Box
The Speech Box (*) is a wired remote speaker and microphone device designed for indoor use. When used with the PowerMaxPro control panel, the Speech Box provides remote audio capability to enable two-way voice communication between the user and the central station or private telephone. Visual operation is indicated by a single steady LED.
* Not UL listed.

F5. Compatible GSM Modem
The internal GSM modem enables the PowerMaxPro system to operate over a cellular network. For details regarding the GSM modem features and connections, refer to the GSM Modem installation instructions.

F6. PowerLink
The internal PowerLink enables you to view and control the PowerMaxPro system over the Internet. For details regarding the PowerLink features and connections, refer to the PowerLink user guide.

F7. Prox Tag
The proximity tag enables you to perform a variety of functions without entering user code, for example, arming, disarming, reading the event log, etc. Whenever the user code is required, you can simply present a valid proximity tag and perform the desired operation without the need to key-in your user code.

* Not UL listed.

If the equipment is causing harm to the telephone network, the telephone company may request to disconnect the equipment until the problem is resolved.

Note: For additional products refer to www.visonic.com.
WARRANTY

Visonic Limited (the “Manufacturer”) warrants this product only (the “Product”) to the original purchaser only (the “Purchaser”) against defective workmanship and materials under normal use of the Product for a period of twelve (12) months from the date of shipment by the Manufacturer.

This Warranty is absolutely conditional upon the Product having been properly installed, maintained and operated under conditions of normal use in accordance with the Manufacturers recommended installation and operation instructions. Products which have become defective for any other reason, according to the Manufacturers discretion, such as improper installation, failure to follow recommended installation and operational instructions, neglget, willful damage, misuse or vandalism, accidental damage, alteration or tampering, or repair by anyone other than the manufacturer, are not covered by this Warranty.

The Manufacturer does not represent that this Product may not be compromised and/or circumvented or that the Product will prevent any death and/or personal injury and/or damage to property resulting from burglary, robbery, fire or otherwise, or that the Product will in all cases provide adequate warning of protection. The Product, properly installed and maintained, only reduces the risk of such events without warning and it is not a guarantee or insurance that such events will not occur.

This Warranty is exclusive and expressly in lieu of all other warranties, obligations or liabilities, whether written, oral, express or implied, including any warranty of merchantability or fitness for a particular purpose. The Manufacturer shall not be liable to anyone for any consequential or incidental damages for breach of this warranty or any other warranties whatsoever, as aforesaid. The Manufacturer shall in no event be liable for any special, indirect, incidental, consequential or punitive damages or for loss, damage, or expense, including loss of use, profits, revenue, or goodwill, directly or indirectly arising from Purchaser’s use or inability to use the Product, or for loss or destruction of other property or from any other cause, even if Manufacturer has been advised of the possibility of such damage.

The Manufacturer shall have no liability for any death, personal and/or bodily injury and/or damage to property or other loss whether direct, indirect, incidental, consequential or otherwise, based on a claim that the Product failed to function.

However, if the Manufacturer is held liable, whether directly or indirectly, for any loss or damage arising under this limited warranty, The Manufacturer’s maximum liability (if any) shall not in any case exceed the purchase price of the Product, which shall be fixed as liquidated damages and not as a penalty, and shall be the complete and exclusive remedy against the Manufacturer.

When accepting the delivery of the Product, the Purchaser agrees to the said conditions of sale and warranty and he recognizes having been informed of it.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so these limitations may not apply under certain circumstances.

The Manufacturer shall be under no liability whatsoever arising out of the corruption and/or malfunctioning of any telecommunication or electronic equipment or any programs.

The Manufacturer’s obligations under this warranty are limited solely to repair and/or replace at the Manufacturer’s discretion any Product or part thereof that may prove defective. Any repair and/or replacement shall not extend the original Warranty period. The Manufacturer shall not be responsible for demanding and/or reinstalation costs. To exercise this warranty the Product must be returned to the Manufacturer freight pre-paid and insured. All freight and insurance costs are the responsibility of the Purchaser and are not included in this Warranty.

This warranty shall not be modified, varied or extended, and the Manufacturer does not authorize any person to act on its behalf in the modification, variation or extension of this warranty. This warranty shall apply to the Product only. All products, accessories or attachments of others used in conjunction with the Product, including batteries, shall be covered solely by their own warranty, if any. The Manufacturer shall not be liable for any damage or loss whatsoever, whether directly, indirectly, incidentally, consequentially or otherwise, caused by the malfunction of the Product due to products, accessories, or attachments of others, including batteries, used in conjunction with the Product. This warranty is exclusive to the original Purchaser and is not assignable.

This warranty in addition to and does not affect your legal rights. Any provision in this warranty which is contrary to the Law in the state or country where the Product is supplied shall not apply.

Warning: The user must follow the Manufacturer’s installation and operational instructions including testing the Product and its whole system at least once a week and to take all necessary precautions for his/her safety and the protection of his/her property.
